1 INTRODUCTION

1.1 Scope

This annex sets out the background to, and basis for the financial and economic analyses used in the Southwest Area Water Resources Management Project (Flood Action Plan 4) Study (TA No 1498-BAN funded by the Asian Development Bank). It covers the derivation of prices used and describes the methods and assumptions adopted for the analyses.

The SWA study has been confined to flood control and drainage (FCD) and irrigation (I) development possibilities with no Non-FCD/I interventions (ref. Chapter 3).

Two levels of analysis were undertaken: regional and project specific.

Regional Studies

The regional level analyses were directed to the ranking of technically feasible development proposals in terms of their economic internal rates of return (EIRR), benefit: cost ratio (B/C) and net present values (NPV) of net benefits. The analyses were undertaken at economic prices (or values) and two other major evaluation parameters described in this Volume; labour and nutrition. The prices, crop budgets, labour requirements, nutrient compositions etc. discussed in this Volume were all included as inputs into the Resource Allocation and Optimisation Model (RAOM). The Model was developed as a tool for the regional multi-sectoral analyses that were necessary. A description of RAOM used in the SWA study is provided in Volume 5. The regional studies were directed to the provision of a semi-detailed evaluation of the interventions considered appropriate to improve water resource management in SWA. The study's objectives were to screen alternative development options and it was the first major stage in the selection of a number of projects that could be carried forward for further studies.

The results of the regional analyses were presented in the Second Interim Report (SIR) (November 1992) and the final, more comprehensive results in Volume 5 RAOM and the Main Report. The technical and economic screening of water resource development options in SWA identified almost 30 possible projects. Further regional analyses, which included initial environmental impact evaluations, took into account the wider implications of water management in the study area. It resulted in the selection of the eight projects for pre-feasibility study that were presented in SIR. The process deliberately selected projects most likely to result in quick returns to investment, high EIRRs and B/C ratios.

The final RAOM analyses resulted in the phased regional water resources development plan described in Chapter 7 of this volume and presented in detail in the Main Report. The economic and financial analyses of the development plan are also given in Chapter 7.

Project Studies

The seven projects resulting from the regional analyses were presented at a pre-feasibility level in the SIR, each project was subjected to separate, rather more detailed analyses than for the regional development plan as far as possible using project specific as well as Planning Unit (ref Section 1.4) data.

After presentation of SIR and the resulting discussions with the Flood Plan Coordination Organisation (FPCO) and ADB two projects were selected for further study: Chenchuri Beel Rehabilitation and the Gorai Augmentation Project. Because of the size of the latter it was agreed that these two further studies would be at the pre-feasibility level not feasibility studies as expected earlier. The two studies are set out in detail in Volumes 12 and 13 of this report, and summarised in the Main Report.

As noted earlier the SWA studies have been limited to the costs and benefits directly related to three water management aspects; regional allocation, FCD and irrigation. They include the costs estimated as needed to mitigate adverse effects on the environment, if they are considered necessary, in addition to the components that are "built in" to the projects directly.

If full advantage of FCD and other developments is to be taken there will be other costs. Costs associated with increasing the effectiveness of institutional support, credit, the provision of production inputs etc. However these would be generally applicable to development in SWA even if no water resource projects were implemented and, therefore, have not been included at this pre-feasibility stage.

1.2 Project Guidelines

The FPCO requires that FAP studies follow certain standard analysis methods to ensure that the various FAP proposals prepared for the different regions are directly comparable. The economic and related analyses presented in this Annex follow the FAP Guidelines for Project Assessment dated May, 1992.

1.3 Source of Data

The project has mainly used data from secondary sources for both the regional and project specific analyses. The principle source for base data has been the Master Plan Organisation (MPO) with additional, updated data from the Bangladesh Bureau of Statistics (BBS). The MPO was a temporary agency, as FPCO is, established for FAP. It has now been superseded by the Water Resource Planning Organisation (WARPO), a permanent body within the Ministry of Irrigation Water Development and Flood Control (MIWDFC).

Other data sources include the various departments within the Ministries of Agriculture, Fisheries and Livestock, Environment and Forests and the Ministry of Shipping. A range of data for comparative purposes was collected directly from officers at the Thana (Upazila) level, these were not used directly in the study analyses however. Further comments on sources of data are given in the following sections. The study schedule and resources reflected the requirement of FPCO that as far as reasonable the different FAP regional studies (FAPs 1 to 6) use information from a standard set of sources in order that their analyses and results can be compared directly.

1.4 Planning Framework

The SWA study area is located in the South West and South Central administrative Regions (ref. Volume 9). It includes 18 MPO Planning Areas, numbers 42 to 59. For regional planning purposes it was divided into 28 Planning Units (PU) grouped into Seven Development Blocks (DB) as shown below:

Development Blocks	Planning Unit
SW North	SW 1,2,4,5,8
SW North East	SW 3,6,7
SW Central	SW 9,10,11,12,13,14
SW South	SW 15 (Sundarbans)
SC North	SC 1,2,3,4
SC Central	SC 5,6,7,10,11,12
SC South	SC 8,9, 13

SW = South West

SC = South Central

The locations of the Development Blocks and Planning Units are shown in Figure 1.1. Table 1.1 indicates which MPO Planning area each PU mainly falls.

* Part

The PUs are based on the 44 Nedbr Afstomings Model (NAM) catchments identified by the Surface Water Modelling Centre (SWMC) and incorporated into the hydraulic models used by the Centre and refined by the SWA study team for use in the FAP-4 study (ref Volume 2, Hydraulic Studies).

The PUs have been used as the basic framework for the SWA study rather than the MPO Planning Areas to reduce the degree of aggregation necessary when using Thana, BAR/AST Soil association and other data than would be possible on the MPO/PA scale. Also, while the MPO/PA are also derived from hydrological boundaries these do not have as much detail as the smaller study PUs.

Figure 1.1

Development Blocks and Planning Units

2 FINANCIAL PRICES AND ECONOMIC VALUES

2.1 General

All the study analyses have been based on 1991 prices as stipulated by FPCO in its May 1992 Guidelines. Financial prices have been converted to economic values using the conversion factors (CF) given in the Guidelines, or relevant composite CFs derived from them.

2.2 Capital and Operation and Maintenance Costs

Capital and O & M costs were derived from a number of sources and where necessary were inflated to 1991 prices.

Construction costs were based on unit rates supplied by the Bangladesh Water Development Board (BWDB) O & M Circles in SWA and the Khulna Zone Highways Department. Unit rates from the five BWDB Circles within SWA showed no great divergence and average rates were used for all projects. However the prevailing rate for embankment construction used by BWDB is based on manual labour with minimal (hand) compaction. While it has been accepted that a large part of work will continue to be labour intensive the standard of materials, fill procedures and compaction will have to be raised especially for the proposed major works along rivers. Some machine compaction will be needed therefore, and the unit rate of Tk 40/m³ has been adopted to allow for this. Full details of construction costs are given in Annex 8, Engineering.

Irrigation system and equipment costs are based on prices supplied by the Bangladesh Agricultural Development Corporation (BADC) and a number of private sector equipment suppliers and contractors. Appendix A provides the detailed basis for tubewell and low lift pump costs at financial and economic prices. The tables in the appendix illustrate the derivation of the economic CFs for capital and operating costs of the irrigation installations.

Operation and maintenance costs include the cost of diesel or electrical pumping as specified for individual schemes and an amount of 3% pa of the capital cost for earthworks and 2% pa for structures from the year after construction.

Economic values were calculated from financial costs using the composite CFs set out in Table 2.1. The CFs take account of the different major cost elements in each construction and O & M works. Details are given in Appendix A.

TABLE 2.1

Capital and Operation and Maintenance Costs : Economic Conversion Factors

Items	Capital Costs		O & M Costs	
	Diesel	Electric	Diesel	Electric
Pumping				
Deep tubewells	0.83	0.81	0.67	1.45
Shallow tubewells	0.85	0.73	0.69	1.36
Low lift pumps 1 cusec	0.84	0.63	0.70	1.31
Low lift pumps 2 cuses	0.62	0.63	0.68	1.36
Floating pumps	0.68	na	0.70	na
Major pump stations	na	0.69	na	1.45
Distribution Systems				
Small scale (DTW, STW, LLP)		0.74		0.74
Large scale		0.77		0.77
Major drainage systems (1)		0.73		0.73
Flood Control embankments (2)		0.71		0.71

Source : Consultants estimates derived from 1992 FPCO Guidelines for Project Assessment and 1991 prices.

- (1) 50% earthworks, 50% structures.
- (2) 75% earthworks, 25% structures.

Table 2.1 also gives the CFs adopted for floating pumps, major (large scale) pumping station and irrigation distribution systems derived from data in Volume 8, Engineering and FPCO Guidelines. The derivation of these last CFs are set out in Appendix B.

The study analyses are at the regional and pre-feasibility levels which lack the detail required to distinguish closely differences between Planning Units. Therefore the CFs have been further weighted to reflect typical FC and D, irrigation type and energy sources. The weightings and resulting CFs applied in the study's screening of proposed developments are summarised in Table 2.2.

TABLE 2.2

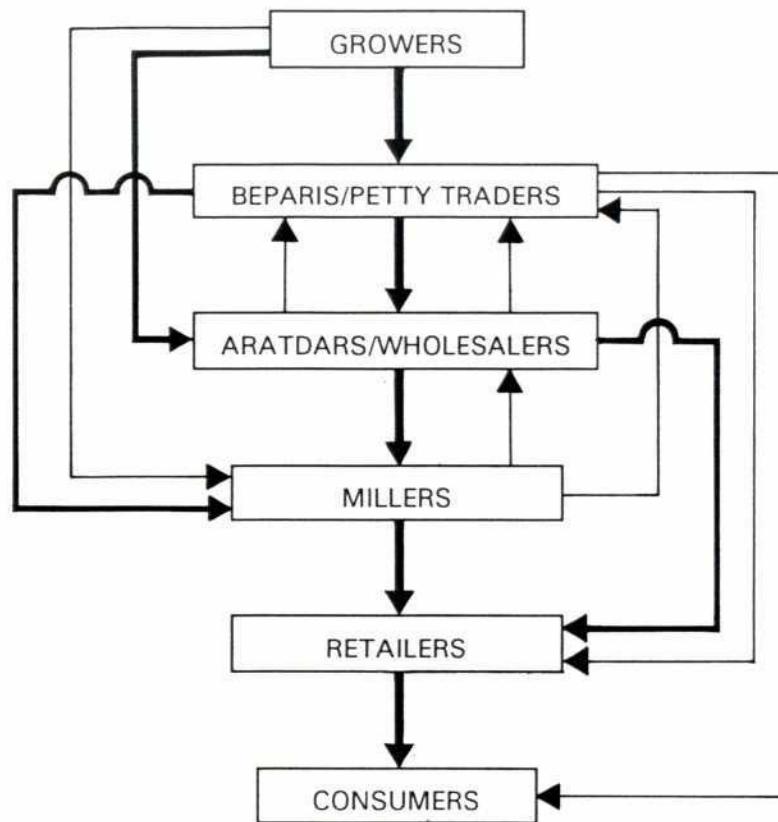

Derivation of Economic Conversion Factors for Development Projects in SWA Resource Allocation and Optimisation Model

IRRIGATION DEVELOPMENT		Small Weighted	Dist.by Barrages	DTW	DTW	STW	STW	LLP	LLP	Large scale

New	0.726	0.71	0.73								
										Cost of diesel energy	0.630
										Cost of electric energy	1.540
										Weighting elec/diesel	0.111

Source: Consultants estimates using FPCO, Guidelines for Project Assessment (1992) Conversion factors and 1991 prices.

2.3 Marketing

There is an extensive primary and secondary network of markets within SWA. Marketing is overwhelmingly within the private sector and is reported to be generally effective for the major crops, livestock and fisheries. However in areas where the transport infrastructure is less well developed local marketing is inhibited and the physical conditions of many markets can be poor. Government involvement in purchasing is declining but the Ministry of Local Government, Rural Development and Cooperatives (MLGRDC) through local administrations are responsible for market management. It is common for the management of local markets to be rented out to private agents. The structure of the marketing system is outlined below:

PRIVATE SECTOR CROP MARKETING CHANNELS

Government operates a network of foodgrain procurement centres. These are not used by the majority of farmers who favour the private market for its more extensive purchasing network, prompt payment, higher prices and informal sector credit availability. Typically crops are sold immediately after harvest to minimise on-farm losses and meet the need for cash and sharecropping obligations. Small livestock are marketed at most centres but cattle and buffalo are usually sold through recognised specialised markets held once or twice a week. As for crops, marketing of fish is carried out in the private sector through a similar system of petty traders and wholesalers. The marketing operations of the Bangladesh Fisheries Development Corporation (BFDC) are now negligible though its storage and ice plants at locations where substantial catches are handled - Khulna, Mongla and Barisal in SWA, provide services to the private sector. Typically, however fish quantities marketed are small. Fish are sold fresh and bulking-up within the system is reasonably efficient with acceptable levels of losses to the consumers (Volume 6).

Since the mid 1980s GOB has pursued a policy of transferring responsibility for input supplies from its own agencies to commercial enterprises. The Bangladesh Agricultural Development Corporation (BADC) is now only involved in seed distribution, except jute and vegetables. Fertilisers, other agro-chemicals and irrigation equipment, with the exception of deep tubewells are now in the private sector. The result has been that distribution has become more effective though without the subsidies given before 1988 costs are higher to the farmer for STW and LLP installations than they were under the BADC monopoly.

2.4 Crop Prices

The study analyses are based on 1991 crop prices obtained from the Department of Agricultural Marketing's regular survey of markets in the South West and South Central Regions. Data are collected by the Department from 46 markets. The 21 wholesale and 25 grower markets are shown on Figure 2.1 and listed by MPO Planning Area and SWA Planning Unit in Table 2.3.

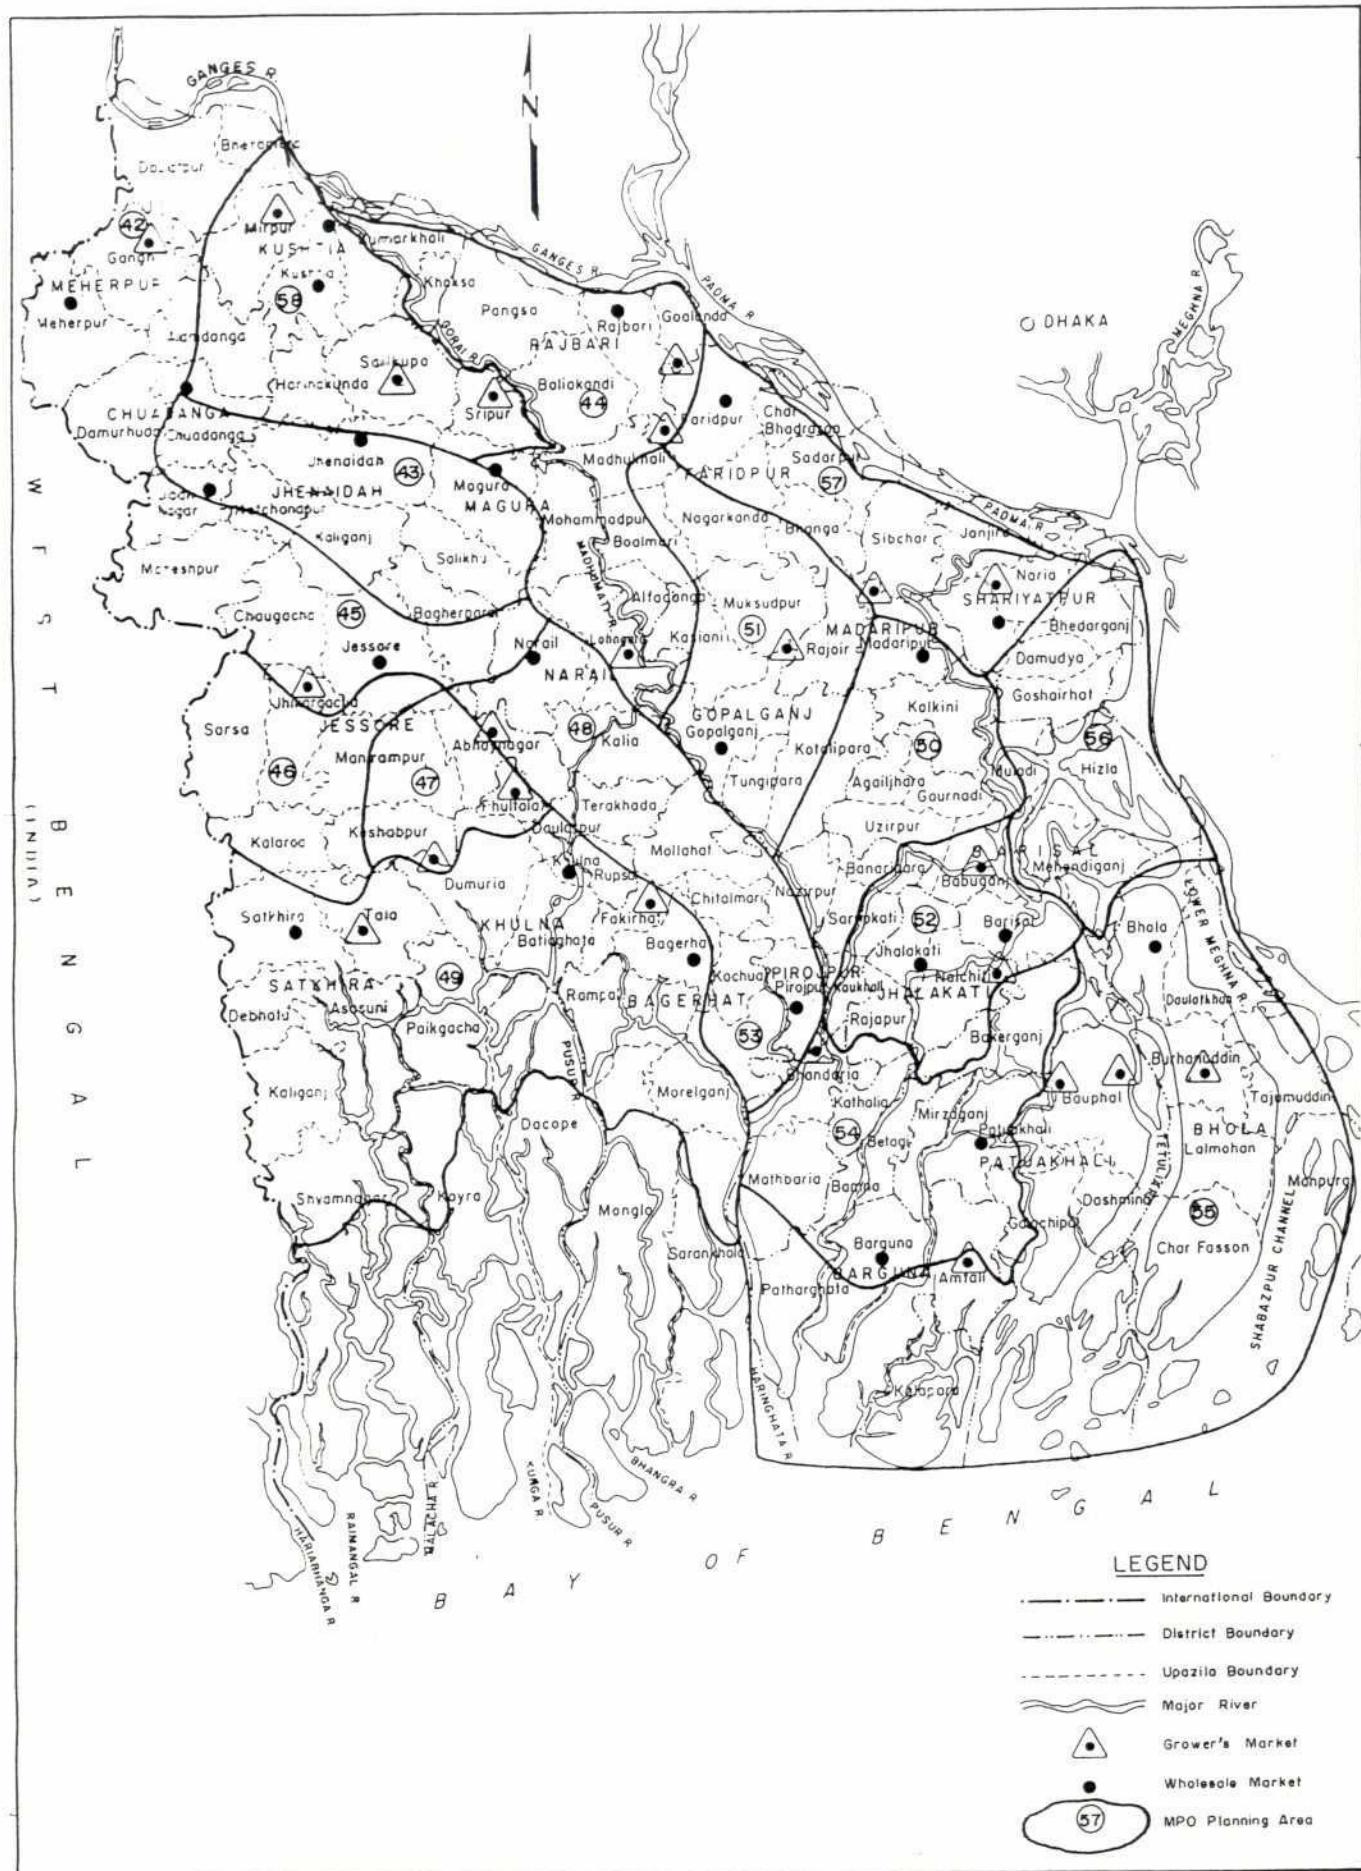

The prices used in the analyses are those recorded at the growers markets. These are the primary centres mainly used by farmers. At these markets farmers sell predominantly to small scale traders (beparis) who move commodities to the larger wholesale markets where they are purchased by wholesalers (aratdars) and millers. The general structure of the marketing chain has been illustrated in the previous section.

The financial prices used are for the latest, 1991, harvest months appropriate to each crop. These prices are set out in Table 2.4. The table shows three price levels: average, high and low which reflect the variation in producer prices within the Study area and have been defined as follows:

- Average prices are the means of the figures derived from data for all 25 growers markets.
- High prices are those for each PU in excess of one standard deviation above the SWA mean price.
- Low prices are those for each PU below one standard deviation below the SWA mean.

The economic values of crops which are also set out in Table 2.4. They were derived from the financial prices by the application of the economic conversion factors given in the FPCO's Guidelines for Project Assessment dated May 1992. The table also shows the economic conversion factors used.

2.5 Crop Production Inputs

2.5.1 General

Input price data for labour, animal and mechanical draught power and fertilisers were collected directly from staff of the Directorate of Agricultural Extension and Department of Agricultural Marketing at the Thana level as part of the study's field investigations. The data are given in Table 2.6 for each of the 27 PUs (excluding SW 15, the Sundarbans).

2.5.2 Labour

The average financial wage rate for unskilled labour in the study area in 1991 was Tk 42/day. This was for an eight hour day without food, with food the reported rate was Tk 29/day. There were distinct variations within SWA as shown in Table 2.6. Rates are higher than average in the central and southern parts of SCR, Development Blocks SC-C and SC-S, and lower in most of DB SW-N and SC-N. The general variations are illustrated in Figure 2.2. The high and low price levels were defined in the same manner as for crop

prices in Section 2.4 above. The average of the three price categories were calculated with the following results which are used in the analyses:

	<u>Average</u>	<u>High</u>	<u>Low</u>
Labour wage rates			
Tk/day			
Financial ⁽¹⁾	40	50	35
C F	.75	.75	.75
Economic	30	38	26

⁽¹⁾ rounded to nearest Tk 5/day

2.5.3 Draught Power

The crop budgets are based on animal draught power. Mechanical cultivators are used throughout SWR but to a limited extent only.

The cost of hiring a team of bullocks varies throughout the study area, from about Tk 65 to Tk 87 a day. The variations based on DAE Thana data are shown in Table 2.6 and the areas of average, high and low costs are illustrated in Figure 2.3. These costs include the hire of the implement and ploughman. In the crop budgets labour is shown separately and a lower figure, Tk 45/day (financial Tk 39/day economic) is used for all PUs.

2.5.4 Fertilisers

Fertiliser prices were obtained from a variety of sources: Field visits, IFCD Farm level Fertiliser Use Surveys, BBS reports on the use of agricultural inputs for the major crops and a comprehensive questionnaire survey to DAE staff in each of the Thanas in the Study Area. The results of the latter are set out by PU in Table 2.6. The prices are those experienced by growers and reflect the various imperfections in market conditions that affect producers.

Financial and economic prices adopted for the analyses are given in Table 2.7.

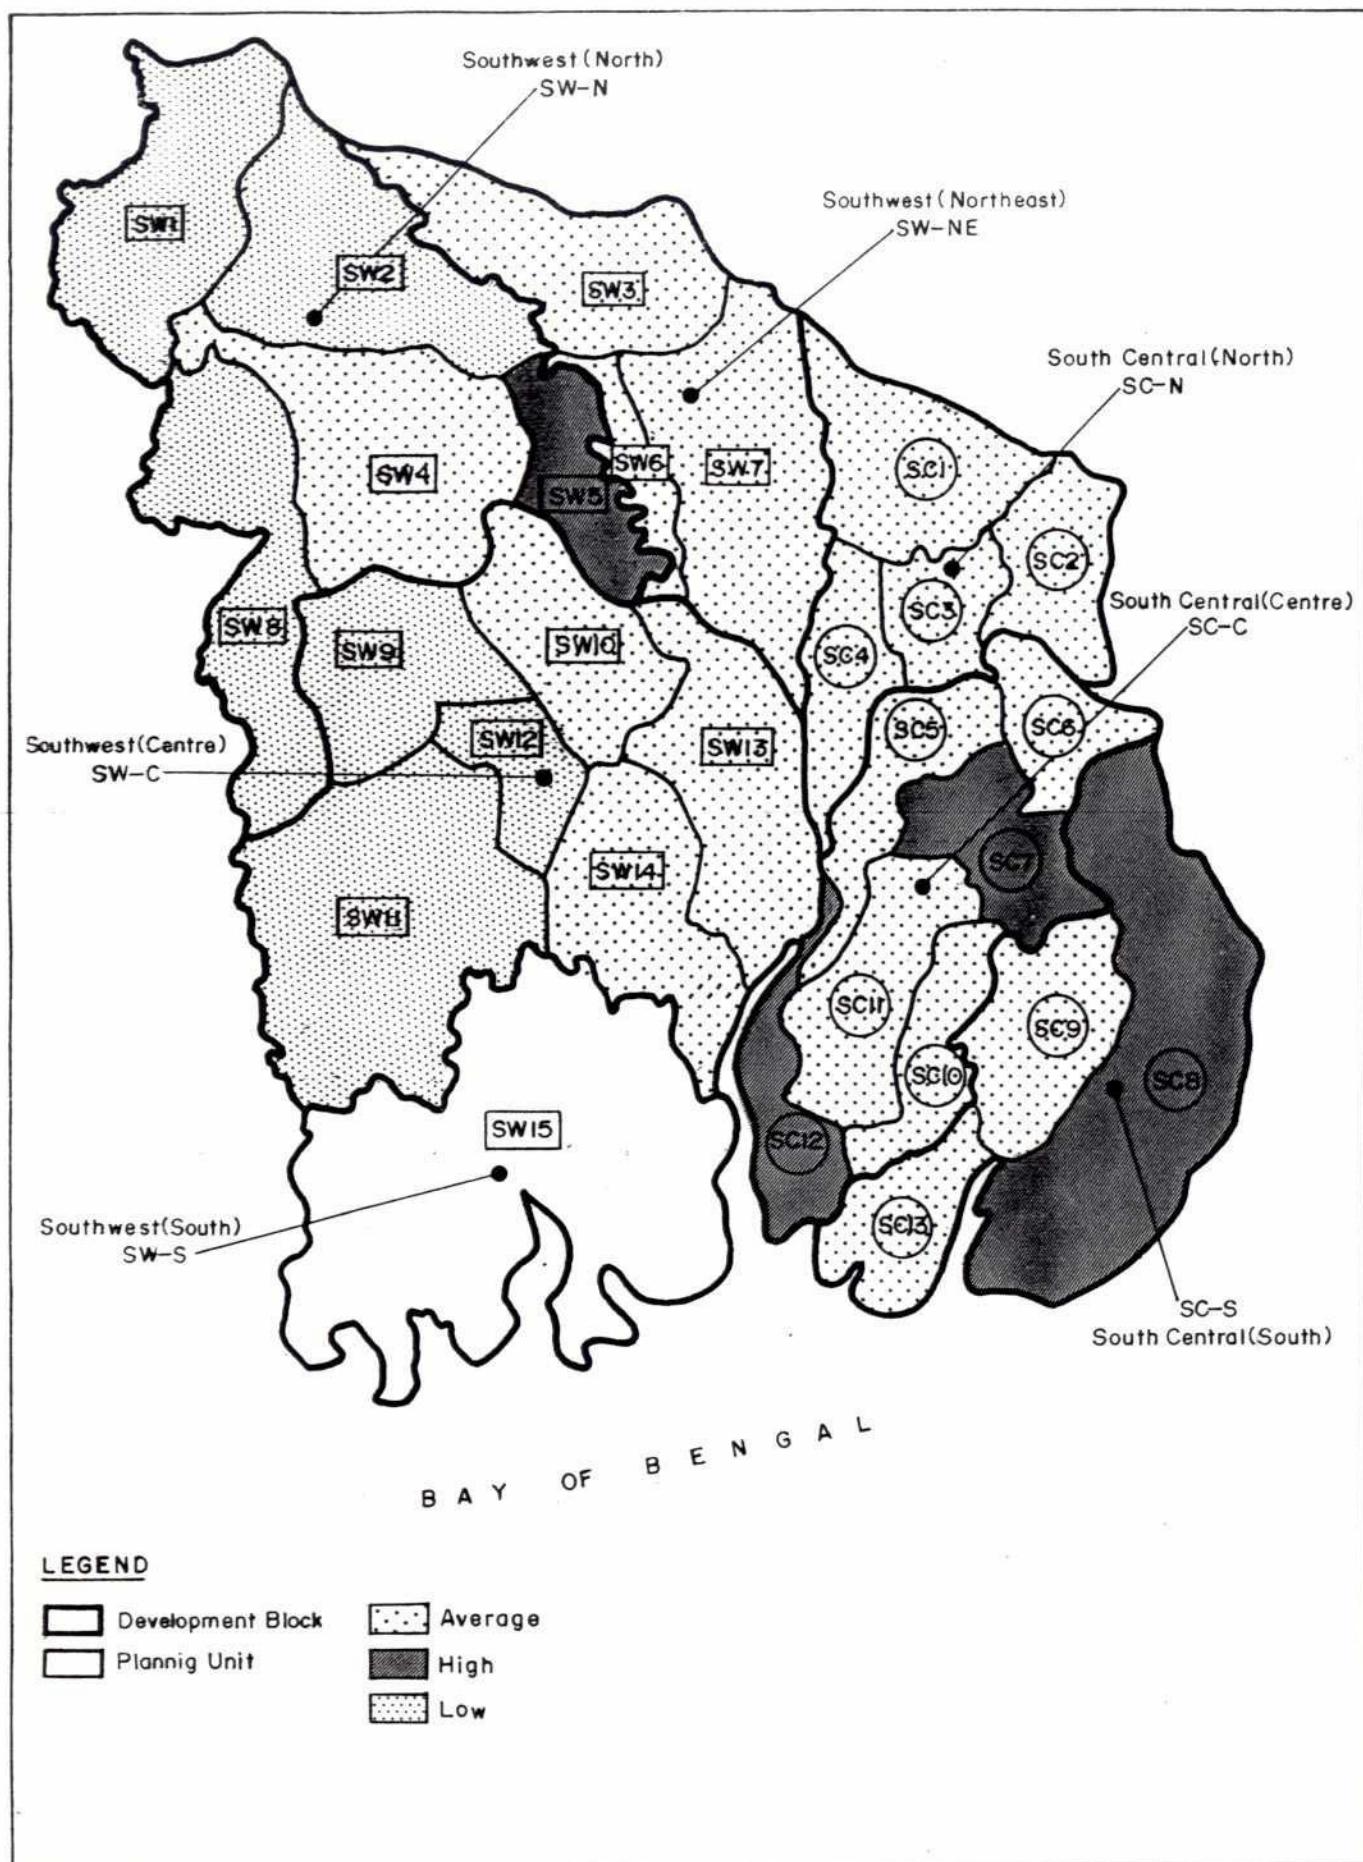

2.5.5 Seed

Farmers frequently use their own seed. Reflecting this the imputed price of seed for all crops except those shown in Table 2.7 has been calculated as x1.5 the value of output which is shown in Tables 2.4 and 2.5.

2.5.6 Summary of Prices

Table 2.7 sets out the financial prices and economic values that have been adopted for the study analyses.

Figure 2.3

(1) Cost of bullock and plough hire only-does not include cost of ploughman.

2.6 Fish

Prices of fish at the primary markets vary throughout SWA according to location and the species sold. The study findings about the sector are described in detail in Volume 6, Land

Resources, Agriculture and Fisheries. However data on local prices are not as comprehensive as for crops and one set has been adopted for use in the analyses. The prices used were considered broadly typical of those prevailing in 1991 and a CF of 1.25 has been used in deriving economic value of fish. The value of 1.25 has been adopted from FAP-12/13 studies.

Source	Financial Tk/kg	Economic Tk/kg
Capture	35.0	44.0
Culture	50.0	62.5
Shrimp: export	133.0	166.0
Local sales	20.0	25.0

2.7 Forest Products

A wide variety of fruit and fuel tree species are grown in SWA in the social forestry sector. Prices used in the study were obtained from consultants field studies and the Swiss Development Corporation - BARI report "Optimisation of Agroforestry Systems in Bangladesh at Household and National Levels" (September 1990). These have mainly been expressed in terms of their annual values each hectare net of costs (ref Section 3.4).

Data on state forestry output prices and costs (Sundarbans) were obtained from the Department of Forestry. Details are given in Volume 7, Forestry and Navigation.

3 BENEFITS AND PENALTIES

3.1 General

The proposals for improved water resource management in SWA arise from a regional strategy for water distribution and use which takes into account water availability, and broad requirements for the agricultural sectors, navigation, urban areas and environmental considerations related to the possible changes in water regimes. The strategy is described in Volume 1, Regional Water Resources Management Plan and the Main Report. The proposed development programmes are centered on projects for flood protection and drainage with irrigation components in most cases. The assessment of benefits and penalties therefore are confined to those arising from FCD and irrigation. These direct quantifiable benefits may be considered the minimum that can be expected. However they can be enhanced if improvements are made in other sectors : credit, production support services, institution strengthening for example. Such developments are not confined to FCD/I however and therefore are not included, in the study analyses. The direct benefits fall into two categories:

- (i) higher output arising from improved water regimes and land resource conditions, and
- (ii) the reduction in agricultural and non-agricultural damage from floods that do not occur every year.

Penalties can also be expected from changes in resource conditions as in the case of fisheries discussed in Section 3.3 below.

3.2 Crops

3.2.1 General

The benefits considered in greatest detail are those expected from crop production which accounts for about three quarters of the value, net of direct costs, of total agricultural, forestry and fishery output in SWA. Three possible sources of benefit were considered; yield, cropping pattern and annual flood damage reduction. Detailed background and base data on the cropping sector are provided in Volume 6; Land Resources, Agriculture and Fisheries.

3.2.2 Yield

Different regimes of water depth and periods of inundation result in crop yield variations which may be substantial. The farmers in-field water management is critical to obtaining the best yields but under most conditions in Bangladesh this is only possible with well designed and operated FCD systems. The SWA proposals for FCD projects can be expected to result in higher crop yields therefore. However there are insufficient data to either assess the changes in inundation patterns resulting from development proposals or to relate these to particular levels of yield in enough detail for the regional and pre-feasibility analyses to include crop yield improvements from FCD as a benefit.

3.2.3 Cropping patterns

Each flood zone category; F0, F1 etc; is associated with a distinct cropping pattern. These relate to both annual cropping intensity and to the types of rice and other crops that are

grown. Overall crop area data for the SW and SC Regions and SWA to illustrate this are given in Table 3.1, for rainfed crops and Table 3.2 for irrigated cultivation. In the kharif season there is an increase in the proportion of sugarcane and HYV rice and a decrease in the other major crops, jute and local rice varieties from the deeper flooded areas (F2, F3/4) to shallower areas (F0, F1). The changes that occur within the rice crops are illustrated below:

	F0	F1	F2	F3/4				
	Percent							
Rainfed								
Rice:								
Local	83	91	100	100				
HYV	17	9	0	0				
Irrigated								
Rice:								
Local	7	35	12	43				
HYV	93	65	88	57				

Table 3.3 shows that the variation between the two study area Regions is not great.

Source: From adjusted MPO data

Under rainfed conditions FCD projects typically result in the absence of the boro rice crop that is grown in the F3/4 areas. The proportion of high value spices and vegetables - mainly sweet potatoes rises. The wheat area decreases, as a result of the lower soil moisture regimes in F0 and F1 areas as shown in Table 3.1.

Irrigation, whether in conjunction with FCD works or not, leads to benefits from a higher cropping intensity in less deeply flooded areas. MPO data, however indicate that annual intensities are higher in rainfed F2 and F3/4 areas.

Irrigation leads to a major increase in boro rice production. Table 3.4 clearly shows that when irrigated areas are within FCD development, where F0 and F1 areas predominate, there is a major shift from local to HYV boro rice:

Under irrigation in the less deeply flooded areas rabi cropping also exhibits higher proportions of wheat, spices and other high value crops such as vegetables and potatoes.

Note: Table 4.3 gives data for total, kharif and rabi (boro) paddy.

The changes in cropping patterns noted above for SWA as a whole arising from FCD and irrigation developments are found in each Planning Unit (ref Volume 6, Land Resources, Agriculture and Fisheries). The degree of the changes varies from PU to PU according to the differences in cropping patterns. Higher value F0 and F1 flood class land is increases at the expense of the less productive F2 and F3/4 classes, the latter being eliminated. While the benefits from such changes vary from PU to PU according to cropping patterns local prices and marketing conditions the figures in Table 3.5 illustrate the benefits without additional non-FCD/I interventions.

The study analyses have been based on the positions found in each individual PU leading first to the initial selection of areas in the RAOM and then to the specific project proposals presented in the Main Report.

TABLE 3.5

Annual Cropping Pattern Gross Margins in each Flood Class (1991 Economic Values)

3.2.4 Unusual flood damage

Table 3.6 sets out the extent of damage to crops from unusual floods. Damage is expressed as the proportion of the total crop area and is the average reported during the 19 years, 1971 to 1989. In the study analyses the economic value of these crop losses, at 1991 prices, has been added to the benefit from changes in cropping patterns discussed above. The benefits do not accrue if irrigation is provided without FCD works.

Appendix C provides damage losses for each crop for each Planning Unit at 1991 economic values.

TABLE 3.6

Kharif Season Average Crop Losses due to Floods 1971-1989

Source: Derived from BBS data.

In some areas damage in the kharif season can be severe as illustrated in Appendix C. Planning Units SW3, 6 and 7 and SC1, 2 and 3 being the worst affected areas. However even in these PUs the extent of damage in terms of the area and value of total annual cropping is as follows, in other PUs the damage does not exceed 3%:

Average Annual Loss (Percent Area)

SW3	6.80	SC1	4.72
SW6	6.88	SC2	7.66
SW7	4.79	SC3	6.47

(Based on BBS data 1971 - 1989)

3.3 Fisheries

Previous studies (FAP 12/13) confirm SWA observations that FCD works have a negative effect on capture fisheries. In practice culture fisheries programmes have not been pursued sufficiently to make up for the losses that culture fisheries suffer. The loss of capture fisheries severely affects fishing households and adversely affects the whole population which has access to flood areas, beels and baors. Culture fisheries development can be no benefit to those with no land (fishing and landless households) or most marginal and small scale farmer's (with less than 1.0 ha) who have too small an area to provide both crop and fish pond areas. Generally larger farmers benefit from the opportunity to develop culture fisheries, and experience so far indicates that culture fishery programmes are not sufficiently pursued or supported to make up for capture fisheries lost when FCD schemes are implemented.

The SWA has a diverse capture fisheries resource that includes production from flood plains, beels and baors as well as the numerous rivers and estuaries in its southern parts. In addition there is a developing culture shrimp culture sector in areas where brackish water is seasonally available, mainly PUs SW9 to 14. The water resource management plan recognises the importance of the shrimp industry to export earnings and development proposals take care not to adversely affect it. It is also acknowledged that the industry has generated social conflict between shrimp farmers, usually the more influential, and rice growers on whose land the shrimp are, seasonally, produced. Volume 6, Land Resources, Agriculture and Fisheries discusses these problems and the proposals made are directed towards enabling the socially weaker rice growers to become small scale shrimp farmers rather than rent out or seasonally lose share-cropped land to entrepreneurs who now typically predominate the cultivated shrimp industry.

The adverse effects of FCD on fin fisheries has been included in the assessment of SWA proposals using the loss estimates given in Table 3.7. The figures in Table 3.7 were applied for all PUs in SWA.

	15	35	10	25	375	44	7	37	550	55

Sources: Consultants estimates and FAP 12/13.

The values of culture, pond and baor, fisheries in each PU are given in Table 3.8 and 3.9 respectively. These are based on current reported yields and together with the figures given in Table 3.10 for shrimp-rice culture were used in RAOM to assess the value of present SWA production and the changes expected with different water resource development proposals.

In the study analyses the following have been assumed:

- Floodplain: F3/4 and F2 areas that are eliminated by FCD works are lost completely and F2 areas that remain suffer the partial loss quantified in Table 3.7.
- Beels and baors: that the same proportion of beels and baors lie within each project area as in the PUs within which they are situated.

- (1) Assumes that shrimp growers vacate land in good time for the aman rice to be transplanted by mid August and that land is available for nursery beds before that time.

3.4 Forestry

3.4.1 General

The effect of SWA proposals on forestry have not been closely defined. However the present value of social and state forestry, the Sundarbans, were taken into account when deciding on a number of aspects of water management and regional allocation in RAOM. Details are given in Volume 7, Forestry and Navigation.

3.4.2 Social Forestry

Broadly SWA is divided into three social or homestead forestry areas. The differences, which are general at this stage, are given in Table 3.11.

TABLE 3.11

SWA Social Forestry Economic Value (1991 prices) (1) (2)

Tree	G M Tk/Ha	Area A		Area B		Area C

(¹) For area location see text. (²) Rounded

The study Planning Units are located within the three major social forestry zones as follows:

	Entire PU	Part PU
Area A	SW 1-4, 8	SW 5-7,9,10
Area B	SW 11-14 SC 8-13	SW 12, 13 SC 5, 7
Area C	SW 7 SC 1-4, 6	SW 10,12,13 SC 5, 7

SW 15 is the Sundarban forest area.

3.4.3

Sundarbans

The value of the Sundarbans arise from a wide variety of resources. A preliminary and approximate estimate of the total value at 1991 economic prices is about Tk.4592 M/Year. This includes an imputed value of fish breeding as well as capture fisheries that amounts to 82% of the estimated total annual value. A breakdown of the value is set out in Table 3.11. This is an approximate estimate.

⁽¹⁾ Area (PU SW15) = 4010 km²

3.5 Employment

The SWA study proposals will generate employment from two main activities : construction and maintenance of FCD and irrigation works and through increased labour inputs mainly in the agricultural sector.

In the agricultural sector more labour will be required as cropping intensities are raised and to handle the higher levels of crop inputs and yields that are made possible by changes in FCD/I conditions. It has been established by FAP 12/13 however, that much of the additional labour needed on farms is met from the farm household's own resources, especially in the case of marginal and small-holdings where there is often a degree of under-employment. Nevertheless this may mean that some small farm families reduce their off-farm employment which then will be available for others. However it has not been possible to assess the extent of the creation of new jobs, as opposed to reducing under employment, but estimates of the increase in total labour requirements for each irrigated and rainfed cropping pattern in each of the 27 PUs were calculated. Details by PU are given in Appendix D for the total areas in each unit. The data are summarised for the two SWA Regions in Table 3.13.

TABLE 3.13

Summary of Total Crop Labour Inputs for Irrigated and Rainfed Cropping Pattern in each SWA Planning Unit

Area	F0	F1	F2	F3/4	Total
Rainfed Sw Region M pd (1) pd ha	56.3 185	95.3 174	35.7 160	10.8 122	198.1 170
SC Region M pd pd/ha	80.1 187	181.9 180	51.7 166	14.7 123	328.7 176
Irrigated SW Region M pd (1) pd/ha	52.0 350	73.8 341	11.1 202	2.9 174	139.8 320
SC Region M pd pd/ha	81.9 351	102.0 343	17.8 205	3.9 170	205.5 321

Source: Derived from various sources including MPO, DAE and BARI
(1) pd = person day.

Rainfed cropping under present conditions requires between 170 and 176 person days each hectare (pd/ha) varying from about 185 pd/ha on F0 land to 122 pd/ha in F3/4 areas. Irrigated cropping requires 320 pd/ha - from 350 pd/ha on F0 to 170 pd/ha on F3/4. With the current ratio of rainfed to irrigated land the overall labour inputs are just over 210 pd/ha.

3.6 Nutrition

The effect of the development proposals and the availability of selected nutrients from agricultural output has been chosen as a key non-economic indicator of benefits. At the scale of the study the assessment has been rather basic. It was confined to gross changes in the production of energy, protein, fat and carbohydrate. Insufficient data were available to forecast the net effect on households of different social classes, nevertheless the indicators are of value in the formulation of the direction of development at the regional level and a relevant indicator for the pre-feasibility studies. The results of the nutrition analyses are set out in Volume 9, Impact Studies.

The source for the nutritional content of the different commodities was "Tables of Nutrient Composition of Bangladeshi Foods" published in 1988 by Helen Keller International and the World Food Programme.

The data used in the study analyses are set out in Tables 3.14 for rice, wheat and sugarcane; 3.15, pulses; 3.16, oilseeds; 3.17, spices and 3.18 and 4.19 other rainfed and irrigated crops respectively. In the case of all crops except the cereals and sugarcane the figures reflect the different mixtures of the crops found to predominate in each PU (see Chapter 4 and Appendix E).

The data are in terms of the nutrient content in each tonne of crop and were applied directly to the production data in GIS for each PU and flood category to give the present availability of the four nutrient components and estimate the changes that will occur with the proposed interventions in SWA.

The results must be considered approximate and are indicative only. This is the result of (a) the quality of cropping data available and (b) the use of representative crops under the categories pulses, oilseeds, spices and other crops.

For each Planning Unit the present levels of nutrient production in total and per head of the 1991 population are given in Volume 11, Regional Data and discussed in Volume 9, Impact Studies.

4 CROP BUDGETS

4.1 Introduction

The principal and most widespread effect of the study proposals for water resource management in SWA will be on agricultural, particularly crop production. The effect on cropping has been paid special attention therefore. Detailed budgets were prepared at the 1991 economic prices set out in Chapter 2. The levels of yield, physical inputs and cultivation practices found in SWA are discussed in detail in Volume 6, Land Resources, Agriculture and Fisheries. The following sections set out the assumptions made for the study analyses. Because physical conditions, cultural practices, market access and prices vary within SWA (see Volume 6 and Chapter 2 this Volume) a set of budgets were prepared for each PU except SW15, the Sundarbans.

There are two sets of crop area data : Thana (1991/92) figures collected during the Consultants field studies and MPO data. The latter, which are only available for the crop categories shown in Table 4.3, do not illustrate differences in the crop composition in each category throughout SWR and SCR but has been used in the crop area estimates for the study analyses. The composite, typical mixtures are listed in Appendix E.

To show the differences within each crop category by PU the Thana field study data were taken and proportions calculated for the different MPO categories : pulses, oilseeds, spices and other crops, the latter divided according to irrigated and rainfed production. The major crops in each category were used to derive the composite budgets used in the study analyses. Major crops were defined as:

Pulses, oilseeds,spices : any crop or combination of crops that accounted for 70% or more of the total crop category area.

Other crops : on the same basis but using 50% of the total area (separately for irrigated and rainfed crops). The lower figure was used since there were insufficient market data on certain "other crops" including radishes which are widely grown in some areas.

These approximations are considered reasonable when calculating the financial and economic value of production at the farmgate. However for the calculation of nutritional levels they are less satisfactory. Since the FPCO Guidelines specify that MPO data must be used and it does not show the division between crops in each broad category the production expressed in nutritional terms must be considered as a rough estimate.

4.2 Yields

Tables 4.1 to 4.3 set out the yields used in the calculation of crop budgets. The basis for the figures was the five year mean, 1986/87-1990/91, from BBS for all six districts in SWA combined. Three yield levels were defined; high, low and average; and the five year mean for each individual district determined by reference to these three levels. The yield levels were defined as follows:

- high : one standard deviation or more above the six district mean;
- low : one standard deviation or less below the mean, and
- average: the mean yield for all six districts combined.

The BBS data are provided by Greater District and yields were attributed to Planning Units that fall wholly or mainly within each district, as illustrated in Table 4.1.

Rice and paddy yields

Rice and paddy grain and residue yields adopted are given in Table 4.1. The paddy yields are used in the crop budgets, the rice used in calculating gross production in terms of nutrients (see Section 3.6). The milling outturn used to convert paddy to rice was 67%.

4.3 Physical Inputs

Volume 6 reviews and discusses the use of seeds, fertilisers, labour and other crop inputs in SWA. Labour inputs have been referred to earlier (Section 3.5, Appendix D). These vary between PUs in relation to the different yields used in the budgets. Other physical inputs were assumed to be constant throughout SWA since the data that were available indicated relatively small differences. The levels of inputs used are given in Table 4.4 for all crops.

4.4 Crop Budgets

Using the prices, yields and physical inputs discussed earlier crop budgets at 1991 economic values were prepared for each of the 27 SWA Planning Units. The budgets include the value of crop residues which are utilised for fuel and livestock feed. Data on livestock management and production are less detailed than for crops and therefore the fodder value has been taken as representing the value of livestock. Budgets at economic values were used in RAOM generated analyses and also in the analysis of selected pre-feasibility studies for the seven projects presented in the Second Interim Report (November 1992) and the Chenchuri Beel and Gorai Augmentation Project Studies in this Final Report.

Complete sets of the crop budgets are given in Appendix F.

Appendix G shows the rainfed and irrigated total crop gross margins at 1991 economic values for each PU by flood class. These were the values used in the RAOM generated regional study analyses.

5 NUTRITIONAL BALANCES

5.1 Scope

As noted in Section 3.6 the availability of selected crop production nutrition components has been taken as a key indicator of the benefits to be expected from the SWA water management development proposals. The base data from which the results were derived for the assessments was given in Section 3.6. The present, 1991, situation is presented below in terms of output of food energy, carbohydrate, protein and fat from crops. The effects of different development options considered have been evaluated in terms of the changes in gross food energy production.

The scale and nature of the data available and the regional scale of the study mean that the results of the assessments and the accuracy of present availability of the nutrients must be considered only indicative.

The figures represent production and not nutrient consumption or availability to the consumers.

The results are for gross production with no allowances for losses between the field and the consumer nor for imports into each Planning Unit - the base unit used in the study analyses. The indicator is relevant to changes brought about by the proposed water management based plan and does not take into account developments in other fields which may be stimulated by the Plan but are not part of it. The figures should not be taken as direct indicators of changes in consumption though they are obviously indirectly related. They also do not reflect differences in consumption patterns within communities or between family.

The projection of population growth rate assumed a moderate decline of 1.0% per annum in 2010, resulting in a population of 34.6 million in the year 2010, and average annual growth rate of about 1.502 over the period from 1991-2010. Population growth was the only factor in the projection of proportional growth in future food demand.

5.2 Present Nutrient Output

The most reliable data available were of crop production. The estimate of nutrients available throughout the study area therefore has been based on this. The contribution of livestock and fish were not included though their importance is clearly recognised.

It is recommended that all three sources should be covered in feasibility studies which are expected to follow from this study's proposals. At that stage the resources available to collect and analyse more precise, and area specific data are expected to be given.

Table 5.1 summarises the estimated gross output in terms of units available each day for each person by PU in SWA. For the two SWA Regions the figures are summarised below:

	Food energy kcal	Carbohydrate gm	Protein gm	Fat gm
Each person/day				
SWR	2092	422	47.7	11.2
SCR	2142	444	46.7	9.8
SWA	2118	433	47.2	10.6

(Note: From crop production only and before losses from produces to consumers).

The figures in Table 5.2 conceal the significant differences between PUs, which are given in Table 5.1 and by crop and growing conditions in Appendix H. The least and most

productive Pus in these terms are SW12 and SW2 respectively. Table 5.4 (Section 5.3) shows the position in terms of gross food energy production deficits in 1991 derived from production estimates discussed in Volume 6, Land Resources, Agriculture and Fisheries and population figures in Volume 9. These figures include output from culture fisheries - excluding shrimp which is primarily exported from the area and not locally consumed - and crop production.

The data indicate that only four PUs, SW1, SW2, SW8 and SC11 have deficits of less than 10% of requirements of which two, SW2 and SW8, have no deficits. The range of the deficits in 1991 are illustrated in Table 5.2 and later in Figure 5.1.

TABLE 5.2
Summary of Food Deficient by Planning Units

Deficit	Planning Unit		Planning Units	
	No	%	South West	South Central

Source: Consultants' estimates.

⁽¹⁾ Excluding PU SW15, Sundarbans.

Data for each PU is given in Appendix H that identifies the gross quantities of food energy, carbohydrate, protein and fat produced in 1991 by crops throughout SWA. The data are broken down by crop, flood depth category of land and whether from rainfed or irrigated areas.

5.3 Future Gross Production of Nutrients

The forecast changes in gross production of food energy from crops and capture fisheries (excluding shrimp ref Section 5.1) are given in detail, by PU in Table 5.3 and illustrated in Figures 5.1 to 5.4. The cases covered are described below. In each case the data are given for the present, 1991 and 1995, 2000, 2005, 2010 and 2020.

Option 1. Base case.

No Regional Plan option is implemented. However, groundwater is exploited to its sustainable maximum Figure 5.1.

Option 2. FCD and surface irrigation developed without any augmentation of the flows in the Gorai river Figure 5.2.

Figure 5.4

Food Energy Shortage (Ganges Barrage Development)

Option 3. FCD and surface irrigation with augmentation of Gorai river flows which will increase the area of surface irrigation and improve conditions along the Gorai Figure 5.3.

Option 4. As case 3 but with the addition of a barrage on the Ganges river to improve flows along the Gorai. This is the development case recommended by the SWA study. The barrage would be constructed between 2001 and 2005 Figure 5.4.

These four main development options are described in Volume 5, RAOM and outlined in more detail in Chapter 7.

Table 5.4 summarises the predicted deficits under the four development options, including the non-development case. The number of Pus with deficits of less than 10% at the end of each five year period to 2010, and at 2020 are given in Table 5.5.

(2) Case 1 no run for 2005.

The tables clearly show that the chosen development option which includes the Gorai Augmentation Project (ref Volume 12) and the Ganges Barrage will be the most beneficial. Details by PU are given in Appendix I.

6 POPULATION

6.1 Background

The effect of population growth in Bangladesh has been detrimental to its economic development and human welfare. With a density of population that is among the highest in the world ($740/\text{km}^2$), its per capita income (GNP) is one of the lowest (\$189.6). Various NGOs such as CARITAS(NFPP), BRAC, PROSHIKA etc. are working for the Health and Family Planning (HFP) sector in the Southwest Area as elsewhere in Bangladesh. In collaboration with the Ministry of Health and Family Welfare, these NGOs have achieved some success, reducing the national annual growth rate from 2.48% in 1974 to 2.026% in 1991 and forecasts by the Population Development and Evaluation Unit (PDEU) expect the trend to continue.

Population data and characteristics for the SWA study were from a mixture of preliminary, adjusted 1991 Population Census results and earlier studies including the 1981 census and the 1983/84 census of Agriculture.

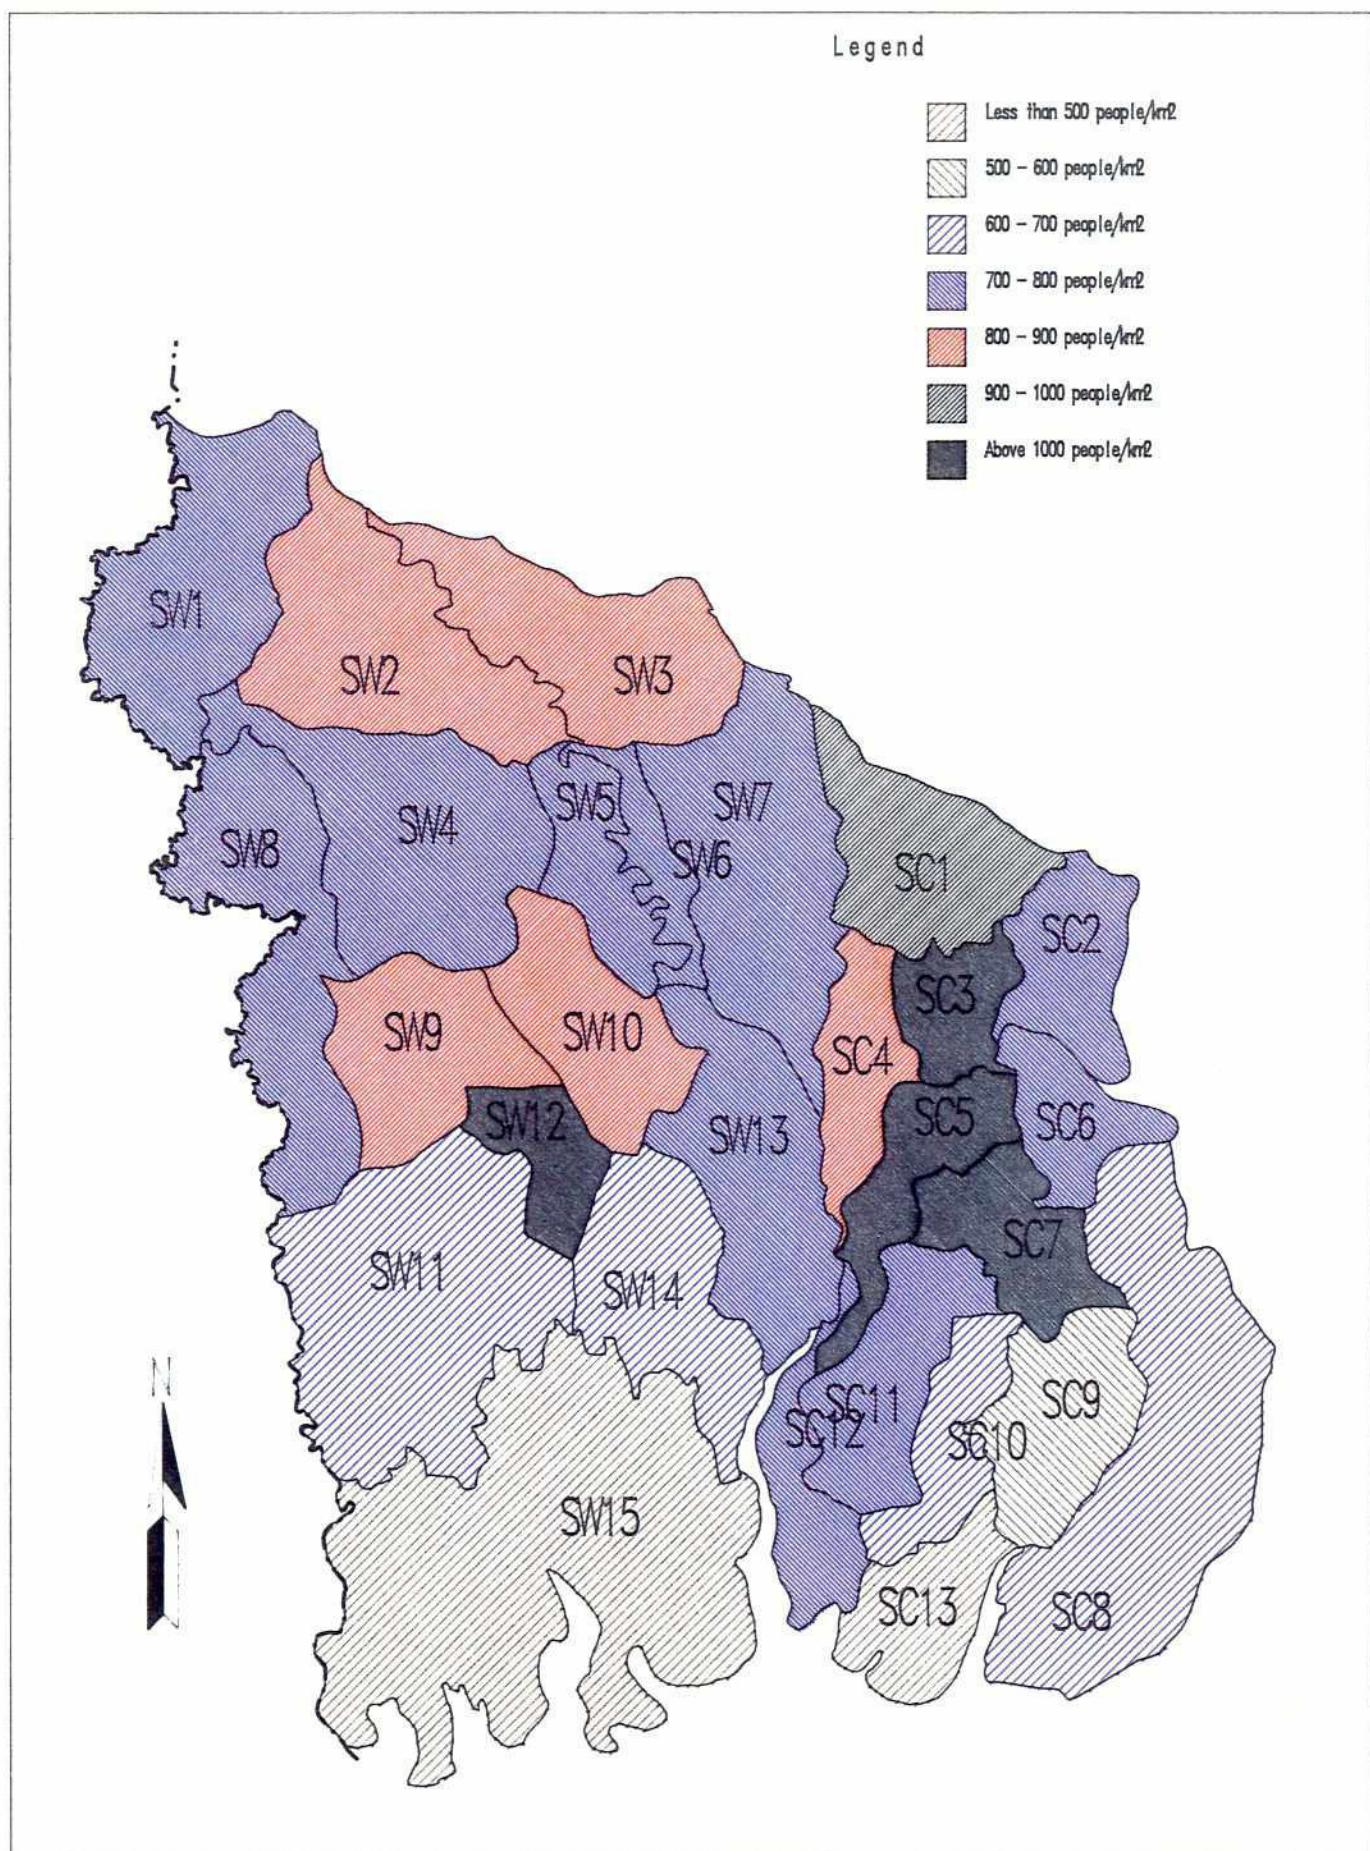

6.2 Present Population

Selected population indicators for SWA are given in Table 6.1. Key population data are presented in Table 6.2 by the Planning Units that have been used as the framework for the SWA Project investigations. The PU figures were converted from the Thana level data published by BBS.

Preliminary 1991 Census data found the SWA population to be 26.1M, almost one quarter of the national total of 109.9M.

Figure 6.1 shows the population density (1991) by Planning Units.

Preliminary Report on Population Census 1991, June 1992, BBS.

(1) Excluding the Sundarbans for which household data were not available.

(2) Dependents = 0-9 and 55+ years of age

(3) Data for fishing households uncertain. Estimate taken from BBS data for landless households.

Sixty four percent of the population were found in SWR. In 1991 population density in SWA 702 pp/km² was compared with 820 pp/km² for Bangladesh as a whole. If the sparsely peopled Sundarbans are excluded overall density rises to 774 pp/km². There were significant variations in density within SWA. Planning Unit SW12, which includes most of

Source : Derived from 1981 and 1991 Population Censuses, BBS.

Note : The discrepancy between PU total and Thana figures arises from adjustment of data to study areas.

Khulna municipality, has the highest density, 1625 pp/km². SC13 the lowest, 408 pp/km² except for SW15, the Sundarbans Forest Reserve which has a small, supposedly transient population of woodcutters and fishermen and a density of about 100 pp/km².

About 91% of SWA's people live in the rural areas. The rural population is lower in the SWR (89%), in which the city of Khulna is situated than, in the less urbanised SCR (95%).

Final adjusted age group figures from the 1991 Census were not available for all SWA at the time of writing. Final 1991 data for five southern districts, however show that 30% (range 28-32%) are under 10 years of age a further 58% (55-61%) between 10 and 49 years and 12% (10-13%) over 49 years.

The literacy rate of the over five year old population varies from 17.73% in Bhola to 10.73% in Jhalakati according to the latest published BBS figures. Typically women have a much lower literacy rate than men, 11-27% compared to 22-40%.

The average male : female ratio in SWA is 105 in SWR, 102 in SCR and at 104 in the whole area it is slightly lower than the National figure of 106.

The average household size in the study area was 5.53 persons in 1991. In the South Central Region it was 5.35, and in the South West it stood at 5.64. Out of the total number of households in the study area, the distribution of rural and urban households were 91% and 98% respectively. The Sundarbans (SW15) had no permanent inhabitants, and therefore, no permanent households. Its transient dwellers were however, estimated at 402,756 in number, all of whom were considered to be rural. The Sundarbans itself has no urban centres.

Small, medium, and large farmers respectively accounted for 68%, 26%, and 6% of total farm households. Barisal (SC6) had the highest proportion (78%) of small-farm households, and the lowest proportion (2.6%) of large farm households.

6.3 Land Ownership

The latest (1983/84) BBS data showed that one quarter of households in SWA were landless; with less than 0.2 ha; and 76% owned land with an average net cultivable area of 0.88 ha, which by 1991 had fallen to about 0.7 ha. Sixty percent of farm households had less than 0.5 ha and only 10% had occurs to more than two hectares. The BBS data showed farm holding to be grouped as follows:

	Marginal (0.21-0.50 ha)	Small (0.51-1.00 ha)	Medium (1.01-2.00 ha)	Large (< 2.00 ha)	All Holdings
SWR % Av NCA ha	27	31	31	11	1.00
SCR % Av NCA ha	31	32	28	9	0.78
SWA % Av NCA ha	28	32	30	10	0.88
National % Av NCA ha	70	25	1.67	5	4.71

Three categories of rural land tenure are recognised; owner operators, tenants and owners-cum-tenants. National figures show 63% of holdings to be owner operated, one percent tenanted and 36% farmed by owner-cum-tenants. In SWA the division between the categories was: owner operator 59-70%, owner-cum-tenants 29-41% and tenants only exceeded one percent in Kushtia District.

Most tenancies are under a share cropping system. Government regulations covering tenancy conditions set out the division of output as: 33% to the landowner, 33% to the share cropper who provides labour and draught power and the balance to whoever provides the other production inputs. In practice local customary arrangements often apply and may be altered at short notice even though legislation provides that unless good reason can be shown agreements should not change for a period of five years. In SWA two main share cropping arrangements are found:

	Labour Draught power %	Other Inputs %	Output %
(1) Owner Sharecropper	-	50	50
	100	50	50
(2) Owner Sharecropper	-	-	33
	100	100	67

Seasonal or annual cash rents also occur but on a small scale and mainly in the Southernmost parts of SWA.

6.4 Employment

The economically active population in the project area constituted 96.2% males and 3.8% females in 1981. But a growing trend has been the gradual decline in the proportion of males in the active labourforce. In 1985 and 1986, the proportion of males in the economically active category was 91.52% and 90.0% respectively. The national figures are similar to the trend in the project area. For the country, in the years 1981, 1985 and 1986, women's participation rates were 5.7%, 9.2%, and 10.5% respectively. the increasing proportions of females joining the economically active category shows a change in the social structure.

In the project area, out of a total population of 26.1 million, 17 million (59.8%) were classified in the working population, while the rest totaling 9.1 million (40.2%) in the non-working group. Narail district, covered by the planning unit SW10, had the highest proportion of working population (74.6%) with an economic dependency ratio of 34- the best in the region. The lowest proportion of working population (53.18%) was in the Bhola district of the Planning Unit (PU) SC8. It also portrayed the highest economic dependency ratio of 88.

As elsewhere in Bangladesh unemployment and underemployment occur on very considerable scales in the study area, in both the rural areas and the urban centres. Sixty-five percent of the total labourforce of the country is agrarian. For the majority of the labourforce, underemployment is a seasonal and temporary phenomenon. Labour migration occurs in large numbers intra-regionally to wherever harvesting and planting demands additional labourforce.

The population active in the labourforce is conventionally held to be within the age range of 14-65 years. In advanced economies, mostly those that are predominantly industrial in nature, this age classification is appropriate, and the reasons are twofold: a minimum level of literacy and/or skill delaying job entry, and a capital-intensive work place delaying job retirement. But in the case of a primarily agrarian underdeveloped economy such as that of Bangladesh children begin to work from an early age (8-10 years). The labour-intensive nature of agricultural work, on the other hand, becomes too strenuous after 55-60 years of age. Therefore, the working population in our study constitutes the population within the ages 10-54 years. The dependency ratios have also been calculated based on the same rationale. The economic dependency ratio for the study area is 67.12%.

6.5 Population Growth

The 1981 - 1991 intercensal population annual growth rate in SWA was 1.89%, lower than the national rate of 2.03% pa. Provisional figures indicate that the rural urban drift was lower in the 1980s than during the previous two decades. In SWA the urban population grew at 4.2% pa between 1981 and 1991 compared to 1.58% pa in the rural areas. The national and SWA figures show there to be positive success in curbing population growth through the countrywide family planning campaign promoted actively by government during the past decades.

The Population Development and Evaluation Unit (PDEU) of the Planning Commission forecast continued progress and expect the growth rate to fall to one percent by 2009. The PDEU's forecasts and the lower than expected 1981 - 1991 growth rate result in the following, possibly optimistic, projections for SWA which indicate that the population will be one third higher by 2010:

	1991	1995	2000	2005	2010
million SWA	26.11	28.28	30.77	32.98	34.66
SWR	16.72	18.12	19.71	21.13	22.20
SCR	9.39	10.17	11.06	11.86	12.46
Density pp/km ²	702	760	825	885	930

Tables 6.3 to 6.6 respectively give the PU populations in 1995, 2000, 2005, 2010 and the population density by PU^a for the years 2000 and 2010 is given in Figures 6.2 and 6.3 respectively.

The forecasts are based on the official BBS national rate of 2.01% pa during the first five year period rather than the lower but unofficial SWA figure of 1.89%. In the absence also of officially released growth rates 2.02% has been applied to both the rural and urban 1991 populations.

The projections show that population densities in SWA can be expected to rise from 702 pp/km², 774 pp/km² excluding the Sundarbans in 1991 to 930 and 1030 pp/km² in 2010. Even if the proportion of farming households remains unaltered at 76% the effect on the farming community will be drastic unless migration to urban centres or out of SWA occurs or, as is most likely the proportion of landless within the rural areas increases very substantially. To retain the same amount of land for each farming household the proportion of landless households (including fishermen) would have to increase from about one quarter in 1991 to 36% in 2000 and 43% in 2010.

21

The present and future estimated figures below illustrate the effect of expected population growth in rural SWA:

	1991	1995	2000	2005	2010
Rural Density (1) pp/km ²	705	765	830	890	935
Cultivable land Ha/Hh (2)	0.595	0.556	0.512	0.477	0.454

(1) excluding the Sundarbans

(2) Based on a total potentially cultivable area of 25608 km² and 5.51 persons each household.

Chapter 5 clearly shows the implications for food production and nutrition if no significant developments take place in SWA even at the low growth rates forecast and assumed in the study analyses.

7 DEVELOPMENT PROPOSALS

7.1 Introduction

The SWA study has resulted in three sets of water resource management development proposals.

- (i) A Regional Plan derived from a number of different options identified by the Resource Allocation and Optimisation Model (RAOM - Volume 5, Part 3);
- (ii) Two pre-feasibility studies, for the Gorai Augmentation (Volume 12) and Chenchuri Beel Rehabilitation Projects (Volume 13) and finally
- (iii) Six pre-investment studies that were originally put forward in the Second Interim Report (also Volume 13).

Full details of the Regional Plan options and the other studies are given in the volumes referred to. The following three sections summarises the results of the economic analyses.

7.2 The Regional Plan

7.2.1 Development Options

The development options were identified from both an appreciation of SWA conditions and the RAOM based studies described in Volume 5 and summarised in the Main Report (Section 5.3).

Four Regional Development Options were identified:

- (i) No Development:
Definition of a reference situation in which no interventions are made other than the progressive development of groundwater irrigation which achieves full resource utilisation by the year 2005; implicit within the reference situation was that groundwater development is essentially a private sector investment which may be presumed to continue to expand irrespective of public sector investments in FCD, surface irrigation and surface water augmentation. This equated with the without project position in the study's economic analyses
- (ii) Development without surface water augmentation:
A similar series of investigations in which it is assumed that public sector investment in FCD and surface water irrigation will progress at an approximately even rate through to the year 2020 alongside groundwater development, the ultimate extent of the works being constrained by physical resources and a minimum benefit/cost ratio of unity (at 12% discount rate) but not by any overall investment limit
- (iii) Development with the Gorai Augmentation Project:
As (ii) above but with the preferred arrangements for the Gorai intake and Kamarkhali weir being in place by the year 2000 and transfers channels completed by 2005, development continuing thereafter to the year 2020.
- (iv) Development with a Ganges Barrage:
As (iii) above with Barrage completed by 2005, the main transfer canals by 2010 and a Hisni transfer by 2020

- (v) Alternative Long-Term Development Options:
 Analyses of the impacts of alternative strategies, such as allocation of flows for the purposes of salinity control, augmentation of South Central Region surface water resources, impacts of varying Ganges flows and alternative objectives for development aside from economic growth.

7.2.2 The Reference Situation

The Reference Situation is taken as one in which, whilst population continues to increase together with food demands, the only development of water resources is groundwater. It is assumed that by the year 2005 all currently available resources would have been developed.

The results indicate that there is potential to develop about 138,000 ha in the Southwest Region and about 156,000 ha in the South Central Region. The main areas of best development potential are in Planning Units SW3, SW5, SW7, SC1, SC2, SC3 and SC4 with limited potential in adjacent Units. The total economic capital cost of this development is approximately Taka 2.9 billion and the NPV (benefits less capital and recurrent costs) is about Taka 19.1 billion, giving an overall benefit cost ratio of about 3.5.

These figures emphasise the profitability of groundwater development and substantiate the assumption that it will continue to occur, providing the necessary credit and technical capability are available.

The main shortcoming of development in the reference situation is that there is relatively little impact at a regional level on the supply of food with shortages in 1991 of 33% and 34% in the Southwest and South Central Regions rising to 50% and 46% respectively.

7.2.3 Development without Surface Water Augmentation

In this series of analyses it was assumed that rehabilitation and construction of new FCD schemes together with surface water irrigation could develop alongside groundwater. It was assumed that development in the South Central of FCDI would be phased over 30 years to 2020 whereas, given the more limited opportunities, development in the Southwest Region would be substantially completed by 2005.

In the Southwest Region it was concluded that development of about 100,000 ha of new FCD schemes was economically viable, together with rehabilitation of around 80,000 of FCD and development of surface water irrigation (LLP) of about 16,000 ha. The figures for irrigation, as throughout the strategic analyses, are based on mean runoff within the two Regions as it is considered this is a more representative assessment of how LLP irrigation would tend to develop than the alternative of using 80% dependable values. (A test was made of the sensitivity to this assumption of irrigable area which revealed about a 17% increase in augmentation flow requirements). In contrast to analyses in earlier reports, no provision has been allowed for the conjunctive use of groundwater and surface water for irrigation as, whilst clearly optimal in terms of resource allocation, the implementation of such schemes is now considered an impractical basis for regional planning.

Development of new FCD in the Southwest was found to be worthwhile mainly in Planning Units SW3 and SW7 where value could be added to groundwater development, with rehabilitation shown viable for similar reasons in SW3, SW5, SW7, SW10 and SW13. The very limited opportunities for expansion of surface irrigation are best focussed on SW10 (using what little Gorai flows are available combined with MB route outflows) and SW13 which benefits from flows from the Swarupkati system.

A similar pattern emerges for the South Central Region with new and rehabilitated FCD found worthwhile mainly in the north-east corner in Planning Units SC1 - SC6 with the exception of SC2 for which little other than groundwater is assessed as viable.

The estimated economic capital costs of the total development (including groundwater) are Taka 1.9 billion and Taka 5.9 billion respectively in the Southwest and South Central Regions with an NPV (benefits less costs) of about Taka 35 billion overall. The benefits/cost ratio overall is estimated to be about 3.5.

Whilst in both Regions these again represent attractive options, in the Southwest Region the development leads only to a marginal improvement in food production, due mainly to the small increase in irrigated area. In the South Central Region, a significant improvement is attained with shortages in 2020 reduced from 49% in the reference situation to 30% with these interventions.

7.2.4 Development with Augmentation of the Gorai

The main options open are to build an intake structure on the Gorai river with associated capital and maintenance dredging, to build a control structure downstream of the Kamarkhali bend, to transfer water east (Link 6) to serve Planning Units SW6 and SW7, or to the west (Links 7 and 8) serving Planning Units SW5 and SW4 respectively, or any logical combination of these. Links 9-11 are options to serve the western areas possible only with the higher command levels available with a Ganges Barrage in place.

Analyses undertaken (Volume 5, Part 3, RAOM) reveal that Link 7, serving Planning Unit SW7 and enabling a reliable supply to reach the proposed intake for Khulna water supply, should be developed first with Links 6 and 8 following thereafter. Whilst assumptions regarding the South Central Region remained as before, it was assumed that the Gorai intake, Kamarkhali weir and Link 7 could all be constructed by the year 2000, with the remaining two Links by 2005 and all other developments completed by 2020.

The South Central Region's results are the same as for the previous situation with no changes. For the Southwest, development potential is significantly increased to about 168,000 ha of new FCD, 139,000 ha of rehabilitated FCD and 186,000 ha of surface irrigation. The availability of cheaper surface irrigation supplies compared to groundwater development indicate that only about 100,000 ha of groundwater would be developed by 2020 compared with about 138,000 ha in the reference situation. Such a conclusion adds credence to the idea that provision of surface water would help enforce a groundwater buffer zone.

The total economic capital costs (including groundwater) in the Southwest are Taka 8.8 billion of which the intake works and NPV of dredging are Taka 2.9 billion and the transfer canals and diversion weir are Taka 1.8 billion. The augmented flow in the Gorai at full development would be about 180 cumec with about 60 cumec to Link 6 and 110 cumec to Link 7, the small balance passing downstream of the weir. The NPV of benefits less costs is about Taka 17.9 billion with benefit cost ratio of about 2.5 overall for the Southwest Region.

The Gorai Augmentation Project brings marked benefits to areas along the Gorai where water may be transferred to, securing significant reductions in food shortages most notably in Planning Units 5 and 6 as well as good improvements in SW7 and SW10. However, overall the Southwest Region would still be some 42% short of food in 2020.

7.2.5 Development with a Ganges Barrage

The final and recommended option includes the construction of a Barrage across the Ganges river.

The presence of a Ganges Barrage would enable construction of any of eleven possible transfer channels within SWA. It also enables flows to be allocated, if required, to salinity control south of Khulna, to augmenting supplies to the South Central Region and, with construction of a Hisni transfer in the west, to the Hisni - Mathabanga system. When constructed, the Barrage will raise water levels to an extent that will virtually eliminate the need for maintenance dredging in the Gorai.

At full development in 2020 the total areas that were shown to be viable to develop in the Southwest Region are approximately 253,000 ha of new FCD, 147,000 ha of rehabilitated FCD and 580,000 ha of surface water irrigation. Groundwater development would be reduced from the reference situation by 49,000 ha to 89,000 ha.

??

The investment and incremental benefit flows for the Regional Plan are summarised in Table 7.1. Details are shown separately for the Southwest Region (SWR) and South Central Region (SCR) and, combined, for SWA. The cost benefit flows in are over a 50 year period in order to include the benefits from the construction of the proposed Ganges Barrage scheduled between 1998 and 2005.

The analysis indicates that the programme will achieve an overall economic internal rate of return (EIRR) of 19.8%; 14.8% for SWR including the Ganges Barrage and 47.8% for SCR. The net present values (NPV) at a 12% discount rate and benefit : cost ratios will be:

	NPV M Tk	B/C ratio
SWR	5147	1.28
SCR	9162	13.27
SWA	18726	1.62

A number of sensitivity analyses were carried out with the results summarised in Table 7.2.

Costs only %		(50.0)							

Source: Consultants' estimates.

The sensitivity analyses show that the overall Regional Plan proposed is likely to be acceptable, in all cases it exceeds the required 12% opportunity cost of capital set by FPCO. The programme for SCR will definitely be acceptable, even if costs increase by 20% and benefits fall by a similar proportion or benefits are delayed two years the EIRR does not fall below 34%. In contrast the proposals for SWR which include the Ganges Barrage can only be considered marginal. The EIRR falls below 12%, to 10.4%, if both costs and benefits change by 20%. The three other sensitivity analyses all reduce the EIRR to between 12% and 13%. However the estimates of costs and benefits have assumed that the full cost of the Barrage is offset against benefits from the Ganges Right Bank. It has not been possible to assess benefits that may be realised from development on the Left Bank. If these were included the SWR Plan could be more attractive.

The above analyses do not take into account the non-agricultural flood damages which will be avoided after the Project is completed. If the non-agricultural damages are taken into account, then the EIRR is slightly better at 21.78%. The details of non-agricultural damages computation are given in Appendix J. Tables 7.3 and 7.4 give the investment and increment benefit flows for the Regional Plan with the non-agricultural damages, and the sensitivity analyses respectively.

As would be expected, the Ganges Barrage development as described has a major impact on food production and in Planning Units SW1 to SW6 and SW8 would create surpluses in 2020. Significant improvements would also be achieved in SW7, SW9 and SW10 also and overall shortages within the Region would be reduced to 25% in 2020. However it may be noted that SW11 to SW14 will still remain in considerable deficit.

20%	2811.34	7726.37	12641.41	17556.44	22471.47

Effect on the B/C Ratio:

Change in Costs	Change in Benefits				
	-20%	-10%	0%	10%	20%
-20%	1.62	1.82	2.02	2.22	2.42
-10%	1.44	1.62	1.80	1.97	2.15
0%	1.29	1.45	1.62	1.78	1.94
10%	1.17	1.32	1.47	1.62	1.76
20%	1.08	1.21	1.35	1.48	1.62

Effects of Delay in the maturing of Project Benefits:

Delay (Yrs)	EIRR	NPV	B/C
	@12%	Ratio	
0	21.78%	18726.23	1.62
1	17.76%	13321.42	1.44
2	15.28%	8496.56	1.29
3	13.50%	4189.49	1.14
4	12.12%	344.70	1.01
5	10.98%	-3087.38	0.90

Effects of Increased Recurrent Costs:

Change in Costs	EIRR	NPV	B/C
	@12%	Ratio	
0%	21.78%	18726.23	1.62
10%	21.55%	18447.09	1.60
20%	21.33%	18167.95	1.59
30%	21.12%	17888.81	1.57
40%	20.91%	17609.68	1.56
50%	20.70%	17330.54	1.54

Switching Values:

For an EIRR of 12%,

The Costs will have to increase by 61.5%, or Benefits decrease by 38.1%.

The results are summarised in Table 7.5 and discussed further in Section 5.

TABLE 7.5
Food Energy Balances Without and With the SWA Regional Plan

	1991	1995	2000	2010	2020

SCR	-	-	-	-	-
With Plan					
SWR	3	3	3	6	7
SCR	1	1	1	1	-

Source: Consultants' estimates.

The Regional Plan will require an investment of Tk 82115 M between 1993 and 2020 at 1991 financial prices.

The flow of investment is summarised in Table 7.6 by five year periods and in Table 7.7 by individual year.

In addition there is expected to be an investment of Tk 3635 M with or without the implementation of the Plan for exploitation of SWA's groundwater resources.

The phasing of costs will be:

	1993 1995	1996 2000	2001 2005	2006 2010	2011 2015	2016 2020
Percent total investment						
SWR ⁽¹⁾	1	12	67	9	6	5
SCR	16	28	26	28	1	1
SWA	2	13	65	10	5	5

⁽¹⁾ Including Ganges Barrage.

The Ganges Barrage will account for 58% of total expenditure and results in almost 70% of expenditure in SWA being scheduled for 1998 - 2005.

The costs of operation and maintenance of the Plan are also given in the two tables. They will rise to Tk 2240 M each year when capital development is complete in 2020.

7.3 Prefeasibility Studies

The results of the economic analyses for the Chenchuri Beel Rehabilitation Project and the Gorai Augmentation Project reflect the two schemes very different cost-benefit structures.

The results of the analyses set out in Table 7.8 are based on FPCO's May 1992 GPA and data from MPO, BBS as well as the Consultants' own investigations. The analyses assumed a 30 year project life with no residual value and a discount rate of 12% in line with FPCO's requirements. The analyses assume a 90% uptake of LLPs in the project areas and a mix of 40% electric and 60% diesel powered pumps, with replacements every eight years. For the analyses 2 cusec pumps were adopted to irrigate 20 ha.

TABLE 7.8

Summary Results of the Economic Analyses of the Chenchuri Beel and Gorai Augmentation Projects (1991 economic values)

Project Indicator	Base case	Costs x 1.2	Benefits x.8	Costs x1. + Benefits	Benefits delayed 2 years
<u>Chenchuri Beel</u>					
EIRR %	30.7	25.3	24.1	19.2	20.7
NPV (12%) Mtk	351.9	282.3	211.9	142.3	212.8
B C ratio	2.01	1.68	1.61	1.34	1.62
<u>Gorai Augmentation</u>					
EIRR %	15.6	12.3	11.6	8.6	11.9
NPV (12%) Mtk	1799.5	174.3	(185.6)	(1810.8)	(44.5)
B C ratio	1.22	1.02	.98	.81	.99

Source: Consultants' estimates.

Gorai Augmentation Project, Volume 12.

Chenchuri Beel Project, Volume 13.

The amounts by which costs have to rise and benefits fall to reduce the base case analyses to an EIRR of 12% are:

	Costs %	Benefits %
Chenchuri Beel	101.1	50.3
Gorai Augmentation	22.0	18.1

The results illustrate the difference in pleasing of costs relative to benefits in the two projects. The financial capital costs for the two projects are summarised in Table 7.9.

TABLE 7.9

Summary of Financial Costs for the Chenchuri Beel and Gorai Augmentation Projects (1991 Prices)

	Project year											Total
	1	2	3	4	5	6	7	8	9	10	11	
Chenchuri Beel M Tk %	149.0 44.6	168.3 50.3	8.6 2.6	8.6 2.5	0	0	0	0	0	0	0	334.4
Benefits start: ■ and reach full development in year 12												
Gorai Augmentation M Tk %	1130.0 8.8	2649.0 20.7	3055.0 23.9	1293.0 10.1	719.9 5.6	1432.4 11.2	1764.5 13.8	459.0 3.6	228.5 1.8	31.7 .2	17.9 .1	12780.9
Benefits start: ■ and reach full development in year 13												

The results indicate that the Chenchuri Beel Rehabilitation Project is likely to be a favourable national investment. The Gorai Augmentation Project in contrast is marginal in economic terms if a 12% opportunity cost of capital is accepted as necessary.

7.4 Other Development Projects

Seven development projects were identified during the study's preliminary screening of development prospects one of which, the Chenchuri Beel Rehabilitation Project, was carried forward for further assessment after SIR (Volume 13).

Table 7.10 sets out selected cost and cost per hectare information for the remaining six projects. The results of the base economic analyses are given in Table 7.11. The high returns reflect the chosen objective to select at this stage only those projects that are likely to give rapid returns and the targeting of the projects to parts of the study area which the SWA studies indicated appear likely to give the greatest benefits to irrigation and related FCD development. Initial analyses such as these, at the early prefeasibility stage, generally result in higher returns than the more detailed, and project area specific feasibility studies do. A number of sensitivity analyses were undertaken and Table 7.12 summarises the results.

APPENDIX A

Derivation of Composite Economic Conversion Factors (CF) for Construction Components

1. Base Components

The FPCO Guidelines (May, 1992) economic conversion factors were used to derive the CFs for construction works using the component cost proportions given in Table B.1 and discussed in Volume 8, Engineering. The weighted, composite CFs are set out in the last column of the table.

TABLE A.1

Basis for Calculation of Economic Conversion Factors of Construction Works

Item	Labour		Materials	Others	Composite CF
	Skilled	Unskilled			
General Earthworks %	5	84	-	11	
CF	.87	.65		.87	
Weighted CF					.69
RC concrete %	2	9	87	2	
CF	.87	.65	.79	.79	
Weighted CF					.78
Mass concrete %	2	5	90	3	
CF	.87	.65	.79	.87	
Weighted CF					.80
Structural Steel %	13	-	72	15	
CF	.87	.65	.75	.87	
Weighted CF					.78
Major Earthworks %	7	78	-	15	
CF	.87	.65		.87	
Weighted CF					.70

Source: Derived from 1991 BWDB and Highways Department costings

(ref Annex 8 Engineering)

CF - FPCO Guidelines, May 1992 Standard CF.

2. Composite Conversion Factors

The CFs adopted for the analyses derived from the weighted CFs in Table B.1 are presented in Table B.2. For each structure or item they are the weighted values according to the proportion of the major cost components involved in the class of work.

TABLE A.2

Derivation of Composite Economic Conversion Factors for
Major Structures and Irrigation Distribution Systems

Structure Item	Earthwork	RC Concrete	Mass Concrete	Structural Steel	Machinery	Composite
Pumping Station % (1) CF	5 .70	24 .78	6 .80	8 .78	57 .62	.69
Small barrages % CF	7 .70	55 .78	8 .80	22 .78	8 .62	.76
Floating Pumps % CF	- -	- -	- -	40 .78	60 .62	.68
Large surface Schemes % CF	13 .69	54 .78	18 .80	15 .78	- -	.77

Guidelines for Project Assessment May 1992 (1991 prices)

(1) percent of total cost.

APPENDIX B

Tubewell and Low Lift Pump Capital and Operating Costs and Derivation of Composite Economic Conversion Factors

1. General

The tables in this appendix set out the financial and economic costs of deep tubewells (DTW), shallow tubewells (STW) and low lift pumps (LLP) that are included in the study analyses, RAOM and pre-feasibility studies. The derivation of the composite CFs are clear from the tables.

The following are covered:

		Capital Table	Operating Table	Irrigation ha
DTW	diesel	A1	A7	20
	electric	A2	A8	20
STW	diesel	A3	A9	4
	electric	A4	A10	4

APPENDIX C

Annual Value of Crop Damage in SWA by Planning Unit.

The tables that follow set out the average proportion by area of major crops damaged over the 19 years 1971 to 1989. The estimated value of these losses is also given in terms of their 1991 economic values (ref. Chapter 2).

APPENDIX D

Crop Labour Inputs

1. Labour Inputs

Table D.1 sets out the labour inputs by crop for each of SWA's 27 Planning Units. The figures have been derived from a number of sources and include data from MPO, and DAE at the Thana level and BARI Farming System Research. They take into account current cultivation practices and yield levels. Within each crop the differences between flood classes and PUs mainly reflect the related yield variations (Ref Chapters 3 and 4 of this Volume).

2. Total Labour Requirements

Estimated Total labour requirements in each PU are presented in Table D.2. Details are given by crop or crop group, flood category and whether or not irrigated.

Differences in inputs for crop groups - pulses, oilseeds, spices and minor crops - reflect differences in the mix of these classes of crops grown in each PU. Further details are given in Chapters 3 and 4 and Appendix E.

APPENDIX E

Composition of Crop Categories Adopted for the Study Analyses

1. Introduction

The table that follows sets out the type and proportion of crops that make up the composite "crop" used in the crop budgets, production and nutrient output estimates in the SWA study analyses.

The crop mixtures are based on data from DAE at the Thana level collected as part of the study from all areas of SWA. Orchards are widely reported but few details were available on their species composition and yields. Consequently the orchard areas have not been included. Estimates for orchards, however are covered under the heading social forestry in Chapter 3 (Section 3.4.1).

TABLE E.1

Southwest Region Crops Representing the Major Crop Categories

PU	Pulses %	Oilseeds %	Spices %	Other Rainfed %	Other Irrig %
SW1	Lentil 100	Mustard 100	Onion 65 Garlic 35	Potato 35 Tomato 65	Potato (100)

APPENDIX F

Southwest Area Crop Budgets at 1991 Economic Values

The tables in this appendix give the crop budgets 1991 economic values for each of the study areas 27 Planning Units, excluding SW15, the Sundarbans. These form the basis for the calculation of the major benefits from flood control, drainage and irrigation developments proposed by the study and for the prior ranking and selection of areas most suitable for water resource management projects by the Resource Allocation and Optimisation Model.

APPENDIX G

Total Crop Gross Margins for each SWA Planning Unit

The set of tables in this appendix give the total rainfed and irrigated crop gross margins at 1991 economic values by flood class for each of the 27 Study Planning Units. These data were used in the RAOM based regional study analyses.

Irrigated Jute and B Aman changed to rainfed and total irrigated and rainfed areas adjusted to 1991 estimates

CROP GROSS MARGINS BY PLANNING UNIT (1991 Economic Values)

APPENDIX H

Present (1991) Gross Production from Crops of Selected Nutrition indicators in SWA.

The Tables attached give details of estimated production and origin of food energy, carbohydrate, protein and fat for each SWA Planning Unit derived from 1991 production data (ref Volume 6, Land Resources Agriculture and Fisheries) and accepted requirements. (Refer to Section 5.2).

APPENDIX I

Future Trends in Gross Food Energy Production Balances

The following tables set out the forecast food energy balances for each SWA Planning Unit without and with the various options identified for the development of water resources in the South West and South Central Regions of Bangladesh under the FAP-4 study. (Ref to Section 5.3).

289

Southwest Area - Results of RAOM analyses
Future trends in Food Energy Balances
No development other than Groundwater

Expressed in G-kcal/year
