BANGLADESH MAPPING FOR DEVELOPMENT 1:10 000
FLOOD ACTION PLAN AREA

FINAL TECHNICAL REPORT
Dhaka, 15 th December 1994

1. GENERAL

1.1. Original Scope of the Works

According to the original scope of works following work amounts were to be carried out for the North-Central Region:

- establish about 100 2nd order GPS-stations.
- to carry out about 1100 km of 2nd order levelling.
- to carry out Black & White and IRC aerial photography at scale 1:50 000 for an area of 18000 km² covering both banks of Jamuna River.
- to carry out Black & White and IRC aerial photography at scale 1:20 000 for an area of 6000 km² of Jamuna riverine area.
- to prepare rectified photomosaics at scale 1:20 000 with superimposed contours at 50 cm intervals for Jamalpur Pilot Area measuring 800 km² using 1:50 000 aerial photography.
- to prepare rectified photomosaics at scale 1:10 000 with superimposed contours at 25 cm intervals for Sirajgonj and Tangail Pilot Areas measuring 100 km² each using 1:20 000 aerial photography.

1.2. Modifications to Original Scope of Works

- Aerial photography for Coastal Mapping Project in 1990 and the one carried out for Third Flood Control Project for BWDB in 1987 left a gap of about 2400 km² in the area of Irrigation Development of South-east Region (FAP-5). Followed by the request from the World Bank with assurances that the area would be incorporated in the "Terms of Reference for Topographical Mapping, Item No 18" and the approval of National Board of Survey to carry out all aerial photography operations of Flood Action Plan this area was photographed at the scale of 1:30 000 at the end of February and beginning of March 1990.

- IR-Colour photography was reduced to cover only areas of Jamajpur (800 km^2), Tangail (100 km^2) and Sirajgonj (100 km^2) pilot areas on the instructions by the World Bank.
- The amount of second order levelling was increased up to its final length of 2468 km after the request from FPCO in November 1990 and the approval of National Board of Survey in March 1991.
- GPS-survey was extended to cover areas of North-West Regional Study (FAP-2) by the request from FPCO in February 1991. This work was carried out immediately after the approval of National Board of Survey in March 1991. After this addition the number of GPS-stations established was 146.

2. GROUND CONTROL SURVEYS

2.1. GPS-Survey

2.1.1. General

Geodetic control over project area was established using static relative GPS-surveys. Total of 146 stations were observed.

2.1.2. Survey markers

Permanent survey markers were constructed according to specifications of Survey of Bangladesh.

Appendix A: Marker description.

2.1.3. Observations

GPS field surveys were accomplished using four (4) Ashtech L-XII GPS-receivers. Ashtech L-XII is a 12-channel, L1-frequency GPS-receiver. One to three observation sessions per day were made using four to eight satellites. Length of the sessions varied from 75 to 180 minutes.

Total number of successfully observed stations was 146 including:

16 1st order stations
130 2nd order stations

2.1.4. Computations

2.1.4.1. Satellite Signal Processing

Carrier phase observations of the GPS-satellites were processed using double difference observables. Double-difference processing was done using Ashtech Inc.'s Geodetic Post Processing Software (GPPS).

2.1.4.2. Primary Network

Primary stations of Flood Action Plan were adjusted together with the primary network of Coastal Mapping Project. The Costal Primary Network consists of 82 Baselines and 57 stations. Point positioning solutions of ten stations were used as initial approximate coordinates for the network adjustment. The network was adjusted in a minimum constraint adjustment using free network technique. The WGS-84 coordinate differences solved in baseline computations were used as observations and WGS-84 coordinates of the stations as unknowns. The relative RMS of the network adjustment was 10 ppm. That for the first order specifications is 1:100 000, 10 ppm.

2.1.4.3. Densification Surveys

Densification surveys consist of two networks and several traverses. Relative RMS of the networks and traverses were better than 1:50 000 (20 ppm), which is the tolerance for second order measurements.

2.1.4.4. Transformation to the New Horizontal Datum 1993 of Bangladesh

According to the decision of Survey of Bangladesh, the new datum was to be established based only on one old station, Gulshan point with following coordinates:

LAT :	23 47 49.547 N
LON :	90 25 6.742 E
H :	9.03538 m

Adjustment was first carried out using Everest ellipsoid with following values for the spheroid:

a :	6377 304 m
1/f :	300.8

Later in January 1993 Survey of Bangladesh supplied new spheroid values based on different meter-to-foot conversion, which are:

1 foot	= 0.30479947 m
--------	----------------

and consequently this gives new spheroid values:

a :	6377 298.52 m
1/f :	300.8

New adjustment was carried out using these new values. Final mosaics were also transformed after this in to the new system.

In addition levelled heights of 19 stations were used in adjustment to fix the new network relative to the local geoid.

The scale of the new datum is that of GPS. Transformation parameters from WGS-84 to the new datum were solved in a least-squares adjustment. Parameters were solved for Molodensky-Badekas transformation model.

The transformation means, that the coordinates of Gulshan point were held fixed and the coordinate system was rotated so, that the square sum of geoidal undulations, height differences between geodetic heights of the stations determined with GPS and orthometric heights of the stations determined by levelling, reached minimum.

The RMS-error in the parameter adjustment was 0.45 m. This means that geodetic heights of the stations can be considered as orthometric with an accuracy of 0.45 m and that the new datum can be considered to be oriented with respect to local geoid three-dimensionally with same accuracy.

After determination of the transformation parameters WGS-84 coordinates of all stations were transformed to the new Horizontal Datum 1993 of Bangladesh.

2.1.4.5. Projection Coordinates

Geodetic latitudes and longitudes of all GPS-stations in the Horizontal Datum 1993 of Bangladesh were converted to map-projection grid-coordinates as determined in the Technical Specifications:

Projection	:	Universal Transverse Mercator (UTM)
Scale factor of Central Meridian	:	0.9996
Unit	:	Meter
Central Meridian	:	90 E
Grid coordinate value of Central Meridian	:	500 000 m
Argument of Longitude	:	87 E < L < 93 E
Latitude of origin	:	Equator, 0 N
Grid coordinate value of northing at origin	:	0 m

9

Appendix B: Location diagram of GPS stations Coordinate lists

2.2. Vertical Ground Control

2.2.1. General

The vertical control network consists of bench marks of second and third order.

In second order levelling check the second order tolerance of $\pm 8.0 \sqrt{K}$ mm (K in kilometres) between forward and backward levelling was always met.

In third order levelling check the third order tolerance of $\pm 12.0 \sqrt{K}$ mm (K in kilometres) in a loop or a line was always met.

In spot height levelling for vertical terrain model the tolerance of $\pm 100 \sqrt{K}$ mm (K in kilometres) was always met.

Third order bench marks were established to serve as starting points in spot height levelling.

Water level stations of the area were connected to the second order lines as second order bench marks.

2.2.2. Recognition of Existing Precise Levelling Network

In all 33 old bench marks were found, 23 west of river Jamuna, 9 east of Jamuna and 1 south of Padma. Only few of them did tally with the neighbouring bench marks within 1st order tolerances.

No previous records about the consistency of the network across river Jamuna existed. Therefore discrepancies between west and east bank of Jamuna rivers could be expected.

Because only few bench marks in the old lines existed, a decision was made to have the old precise levelling lines built and re-levelled to meet the second order standards.

Also levellings across the river Jamuna and Ganges and Padma were required to bring the new levelling networks of different regions in to one uniform system.

2.2.3. Building of Bench Marks

In construction of new bench marks the standards of Survey of Bangladesh were followed.

Following amounts of new bench marks were build:

2nd order	714
3rd	41
Total	755

Sixty of the GPS points were also levelled. GPS markers were build according to Survey of Bangladesh's standards as described earlier.

For river crossing levellings lighter temporary pillars were erected on the river banks.

Appendix A: Specifications for second and third order Bench Marks.

2.2.4. Methods

2.2.4.1. Second Order Levelling

Automatic levels and micro meters were used. Staffs were double reading invar or wooden staffs. For each of the forward and backward levelling four separate readings were taken. Two of the readings came from different staff-scales on the first ground-position, second ground-position providing another two readings.

This method provided 8 independent readings for each levelled distance. Mean of the 8 readings was used as final height difference in computations.

Stability of ground-positions was secured by using heavy metal ground plates.

Equal staff-instrument distances forwards and backwards were measured by tapes. Maximum allowable staff-instrument distance was 50 metres on firm land.

Instrument was always shadowed during observation work.

Staffs were kept in up-right position during observations by build-in bubble-levels.

2.2.4.2. Third Order Levelling

Method was same as in 2nd order levelling with only one ground position in both directions of levelling.

2.2.4.3. River Crossing

Many river divide the project area. 26 separate river crossing measurements were done in order to combine all levellings in to one network.

In river crossings two methods were used. Less than 200 metre-wide rivers were levelled normally. For more than 200 metre-wide rivers simultaneous reciprocal trigonometric method was applied.

Appendix C: Description of the simultaneous reciprocal method.

2.2.4.4. Spot Height Levelling

Spot height levelling was carried out as spirit levelling. All staff and instrument positions were pricked and numbered on pictures during the levelling in the field.

Third and second order bench marks were used as starting and closing bench marks.

Spot height lines were run at 300 m distances with spot height interval of 100 m along the lines.

2.2.5. Equipment

Levelling	Instrument Mark	Amount	Staff Description	Amount
2nd order and 3rd order levelling	Wild NAK-2 Sokkisha B1C	8 4	Invar/wooden double scale	24
spot height levelling	Wild NA-24	12	Wooden single scale	24
River crossing levelling	Wild TC1600	2	Wooden single scale	4

2.2.6. Personnel and Field Works

Personnel used in various kinds of levellings:

Levelling	Teams	Surveyors	Helpers
2nd order	8	8	32
3rd order	4	4	16
spot height	12	12	48
Total	24	24	96

Field observations were commenced in November 1990 and were completed by the end of March 1992.

2.2.7. Existing Bench Marks of Survey of Bangladesh

Before this project no levelling across the river Jamuna had been successfully done in Bangladesh.

For different Flood Action Plan projects it was essential that different parts of the country would be brought in to same datum.

Therefore Jamuna river was crossed at four locations: Ulipur, Badhurabad, Sirajgonj and Aricha.

Also a connection across Ganges-Padma to the south was done from Aricha.

The river crossings confirmed that the old bench marks on both sides of river Jamuna could not be adjusted in one network within 2nd order tolerances. They would tally within adjacent bench marks on same side of the river, but could not fit in to same system across the river.

According to instructions of Survey of Bangladesh Flood Action Plan's 2nd order bench marks were adjusted using old bench marks of the western side of Jamuna river.

The present mean sea level datum of Bangladesh comes from India and is likely to be more correct in western parts of Bangladesh. The eastern bench marks are at the end of over one thousand kilometre long hanging line.

This also explains well the discrepancies of about 20 cm of the old bench marks in the eastern parts.

2.2.8. Computations and Final Adjustment

2.2.8.1. Datum

According to Instructions of Survey of Bangladesh the second order network has been tied to 17 old bench marks on the western side of river Jamuna.

22

Connection Bench Marks:

Name of bench mark	Number used in adjustment	Height (m)
Rangpur DC Office	108001	31.9897
Karmical Collage	108016	32.1186
Mithapukur	108003	28.5558
Uzipur	108004	24.5394
Dhaperhat	108005	24.4056
Palasbari	108006	22.7643
Gobindagonj	108008	20.9199
Nawdapara	108009	19.9955
Bogra Circuit House	300751	19.1177
Ashekpur	108010	18.1542
Kalico Cotton	108101	12.2572
Dhopa Ghata	108103	11.7488
Ataikula	108105	11.3980
Gang Hati	108106	12.3837
Char Gobindapur	108108	13.6925
Kashinatpur	108109	10.4973
Natuabari	108110	12.6870

2.2.8.2. Final Adjustments

All networks and lines have been adjusted with adjustment program MMH200. In first phase program computes heights for knot-points and in second phase line wise heights for other bench marks in the network.

Adjustment program MMH200 has been developed by the National Board of Survey of Finland.

Appendix D: Program description of MMH200.

2.2.8.2.1 Second Order Lines

26 river crossing measurements were included.

Adjustment statistics:

Fixed points:	17
Adjusted points:	850
St. error of one km levelling	4.39 mm
Length of lines	2468.12 km
Instrument stations	25184

Appendix E: Distribution of reference bench marks used in final adjustment.
Distribution levelled water level stations.
Network diagram.
Second order adjustment.

2.2.8.2.2. Third Order Lines

All third order lines have been connected to second order bench marks or knot points and adjusted in one block.

Adjustment statistics:

Fixed points:	40
Adjusted points:	52
St. error of one station	2.18 mm
St. error of one km levelling	6.59 mm
Length of lines	306.96 km
Instrument stations	2891

Appendix F: Line diagrams.
Third order adjustment.

2.2.8.2.3. Spot Height Levelling

Spot height levellings were adjusted in blocks of about 25 km².

Jamalpur pilot area:

Adjustment statistics:

Blocks:	46
Fixed points:	55
Adjusted points:	48859
Average Standard error of on station	15.93 mm

Sirajgonj pilot area:

Adjustment statistics:

Blocks:	10
Fixed points:	16
Adjusted points:	5505
Average Standard error of on station	12.85 mm

Tangail pilot area:

Adjustment statistics:

Blocks:	13
Fixed points:	21
Adjusted points:	8452
Average Standard error of on station	15.37 mm

Individual adjustments have been submitted to Survey of Bangladesh earlier.

3. AERIAL PHOTOGRAPHY

3.1. Technical

Aircraft : Aero Commander 690 A
Camera : 2 x Wild RC 10
Lens : Wild 15 UAG I and Wild 15 UAG II

All photographies were flown in north-south direction. Near Indian border lines were flown following the main direction of the border.

Bangladesh authorities were unable to arrange flying permits nearer than 5 miles from the Indian border. Therefore gaps in the border regions may occur. To minimize these gaps border photographies were shot at higher altitudes.

Following requirements were fulfilled:

Longitudinal overlap : 60% +/- 5%
Lateral overlap : 25% +/- 10%

Appendix G: Index of Black & White aerial photographs.
Index of Infra Red Colour aerial photographs.

3.2. Execution of Photographies

Aerial photographies were initially planned at scale 1:30000 and to be flown in the beginning of 1990 following the photographies of Coastal Mapping Project, which had been being carried out at the time of the planning of photographies for Flood Action Plan. Only an area of about 2400 km² in Noakhali region could be covered within this scope. This area was bordered from west and south by the Coastal Photography Area, by Indian border in the east and Dhaka-Chittagong highway in the north. By mid March 1990 the photography season had passed and no more photographies could be undertaken.

When photographies were resumed in December 1990 also the scope of the works had been changed. It was considered "more adequate" that the aerial coverage should be at scale 1:50 000 for the North-Central Region of 18000 km² and at scale 1:20 000 for the Jamuna riverine area of 6000 km². Also Infra Red Colour photography was not considered necessary for the whole area and it was reduced to cover pilot areas of Jamalpur, Sirajgonj and Tangail only.

All aerial photographies were completed by 24 th of December 1990.

4. AERIAL TRIANGULATION

4.1. Objectives

Aerial triangulation was used to extend ground control to be sufficient for rectification of pictures for mosaic production.

Ground control provides approximately one point for every 6 pictures. In rectification each picture must have 4 known points (xy-coordinates).

4.2. Method

Aerial triangulation was carried out by using the simultaneous bundle block adjustment method and program developed in the National Board of Survey of Finland.

4.3. Ground Control

Ground control was established using GPS as follows:

Area	No of points
Jamalpur pilot area	11
Sirajgonj pilot area	8
Tangail pilot area	8

GPS points used as horizontal ground control for the pilot areas were observed in connection of GPS-survey for the North-West and North-Central regions. Network has been newly adjusted according to Instructions of Survey of Bangladesh, also all old Survey of Bangladesh' points.

In addition to heights of GPS points vertical ground control was provided by spot height levelling.

Prior aerial photography the GPS points, which were necessary for pilot areas' aerial triangulation, were pre-marked.

4.4. Aerial Photography

Aerial photography on the scale of 1:50 000 was used in Jamalpur pilot areas and on the scale 1:20 000 for Sirajgonj and Tangail pilot areas. Flight lines were in north-south direction.

Area	Runs used	Scale
Jamalpur pilot area	4	1:50 000
Tangail pilot area	5	1:20 000
Sirajgonj pilot area	4	1:20 000

4.5. Equipment

Observations were done with Leica BC3 analytical stereo plotter.

All adjustments were carried out by using a Bench Mark 486-C25WT computer and MMH850 adjustment program.

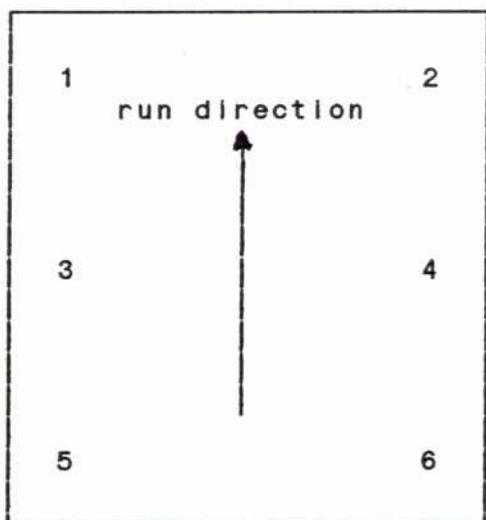

4.6. Selection of Rectification Points

One set of contact prints and diapositives were used in aerial triangulation.

All visible ground points were marked and numbered on the contact prints.

Because the tie points resulting from aerial triangulation are small and seldom visible in dark room conditions during rectifications, separate by bare eyes visible points of higher contrasts were selected. To enable smooth and uninterrupted features across the seam areas on the mosaics, rectification points were also transferred picture wise not only in the run direction but to adjacent strips as well. In normal full picture condition 6 rectification would fall within each picture.

Distribution index of the rectification points:

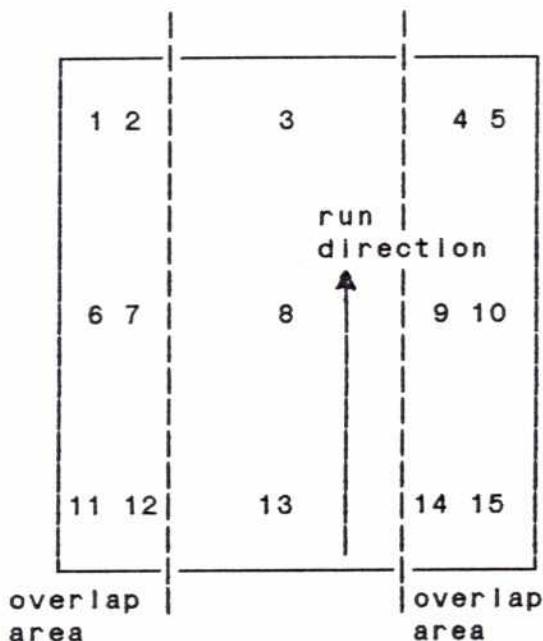

22

4.8. Point Transfer

Tie point were selected so that one row of points was in the centre of the run and two rows of points on the overlapping areas of the adjoining strips.

Distribution index of the tie points:

4.9. Adjustment

Adjustment was carried out using the simultaneous bundle block adjustment program MMH850 developed by National Board of Survey of Finland.

Each of the three pilot areas were adjusted in separate blocks.

1. Jamalpur pilot area:

Statistics of adjustment:	Total	Rejected
No. of photographs	64	0
No. of additional parameters	12	0
No. of points in adjustment	316	0
xyz-control points	11	0
xy-control points	0	0
z-control points	36	0
tie points	269	0
No. of observations	2345	0
control point coordinates	69	0
image coordinates	2276	0
redundancies	1001	0
Standard error of unit weight		
on the ground	.429 m	
on the image	14.2 microm	

2. Sirajgonj pilot area:

Statistics of adjustment:	Total	Rejected
No. of photographs	38	0
No. of additional parameters	12	0
No. of points in adjustment	215	0
xyz-control points	8	0
xy-control points	0	0
z-control points	17	0
tie points	190	0
No. of observations	1467	0
control point coordinates	41	0
image coordinates	1426	0
redundancies	582	0
Standard error of unit weight		
on the ground	.213 m	
on the image	7.1 microm	

87

3. Tangail pilot area:

Statistics of adjustment:	Total	Rejected
No. of photographs	62	0
No. of additional parameters	12	0
No. of points in adjustment	261	0
xyz-control points	8	0
xy-control points	0	0
z-control points	20	0
tie points	233	0
No. of observations	2044	0
control point coordinates	44	0
image coordinates	2000	0
redundancies	877	0
Standard error of unit weight		
on the ground	.189 m	
on the image	6.3 microm	

Appendix H: Aerial adjustment index.
 Adjustment and coordinate lists of Jamalpur pilot area.
 Adjustment and coordinate lists of Sirajgonj pilot area.
 Adjustment and coordinate lists of Tangail pilot area.

5. CONTROLLED PHOTO MOSAICS WITH CONTOURS

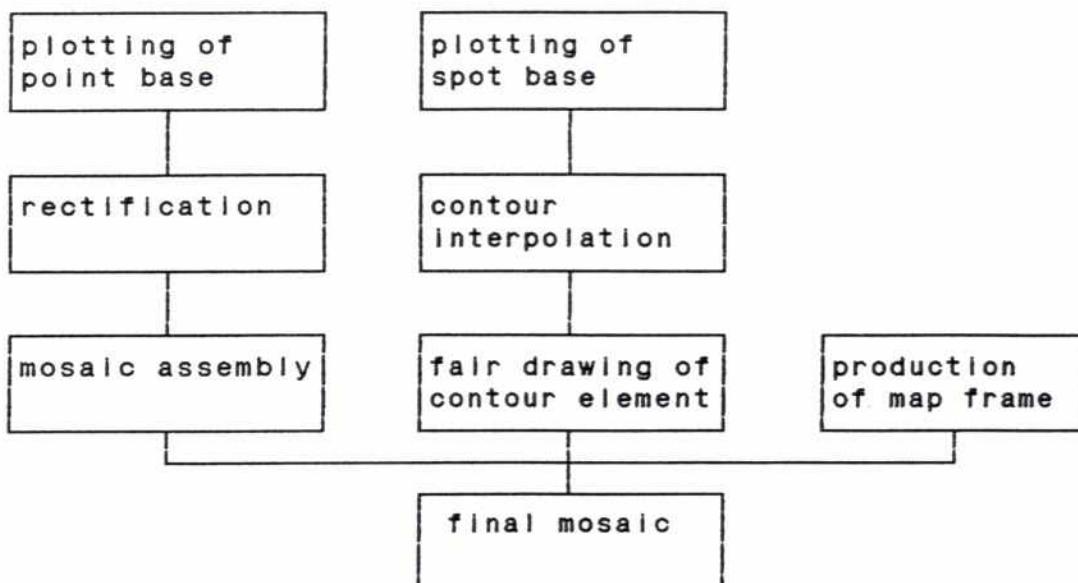

5.1. General

Production of controlled mosaic following aerial triangulation and computation of spot elevations involves following phases:

- plotting of point base for rectification
- rectification
- mosaic assembly
- plotting of spot base for contour interpolation
- contour interpolation
- fair drawing of contour overlay
- combining mosaic assembly and contour overlay

5.1. Mosaic Production

Diagram for mosaic production:

Plotting of point base was carried out using Wild TA10 plotting table with on-line connection with BC3 stereoplotter.

Rectification was done using Wild E4 rectifier.

Spot base was plotted by transferring spot height locations from field copies and spot heights resulting from levelling adjustments on a transparent stable material.

In manual contour interpolation rectified mosaics and stereoscopic picture-pairs were used.

On final combination copies contours were superimposed in black over the controlled mosaic.

Mosaics were printed on high resolution photographic paper.

Appendix I:
 Jamalpur sheet index 1:20 000
 Sirajgonj sheet index 1:10 000
 Tangail sheet index 1:10 000

6. CHECKING OF WORKS

6.1. Technical Checking of National Board of Survey of Finland

National Board of Survey of Finland has carried out checking of following phases and approved them:

- aerial photography
- GPS-survey
- aerial triangulation
- second order levelling
- river crossing levelling
- third order levelling
- spot height levelling
- contour interpolation
- final mosaics

6.2. Technical Checking of Survey of Bangladesh

Survey of Bangladesh has carried out checking of following phases and approved them:

- second order levelling
- river crossing levelling
- contour interpolation
- final mosaics

After completion the checking of second order and river crossing levelling a clarification meeting was held in Survey of Bangladesh on the 28th of July 1993. In this meeting Survey of Bangladesh approved all second order levellings including river crossings.

The negligible difference of 3.1 cm over 2.7 km distance across river Padma was considered to be caused either by the long distance or that TBM-8201 was probably disturbed between the two levellings or both these factors together. Bench mark TBM-8201, which Survey of Bangladesh had used in their checking, was a lighter temporary bench mark, which had been build near river bank and had been submerged during the flood between the two levellings.

7. FINAL PRODUCTS

7.1. Ground Control Surveys

7.1.1. GPS-survey

- 3 sets of point description cards

7.1.2. Second order levelling

- 3 sets of bench mark description cards

7.1.3. Third order levelling

- 3 sets of bench mark description cards

7.2. Aerial Photographies

7.2.1. Black and White Photography

- original films
- 3 sets of contact prints

7.2.2. Infra Red Colour Photography

- original films
- 1 set of contact prints

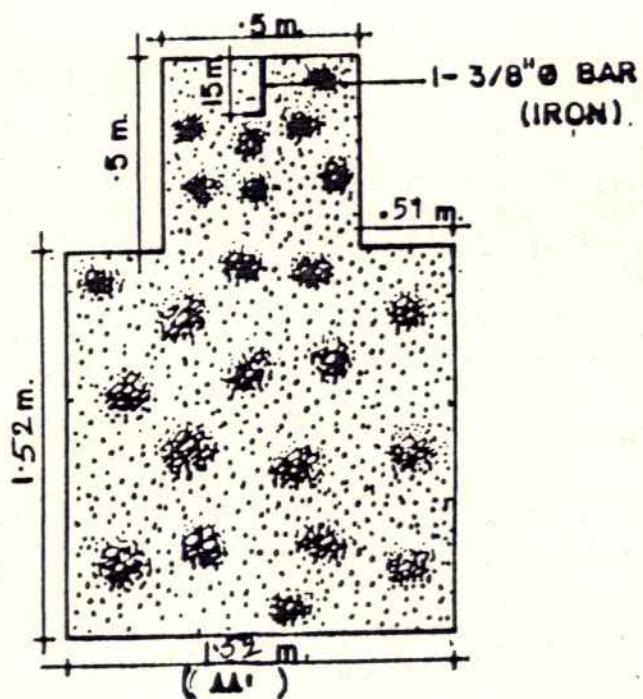

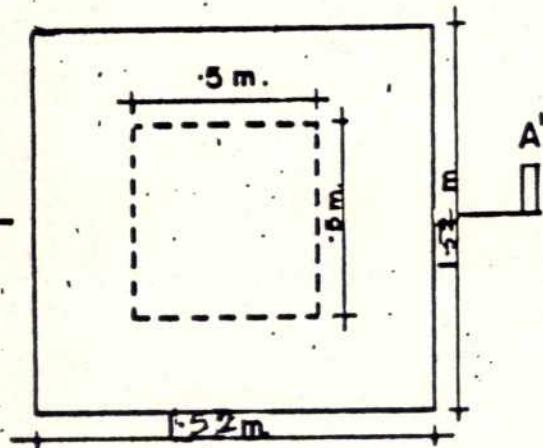

7.3. Controlled Mosaics

- mosaic negatives
- 1 set of controlled mosaics
- 6 sets of additional copies were printed on request

I. TRAVERSE PILLAR:

Base: 1.52 m x 1.52 m x 1.52 m
 Top : 0.50 m x 0.50 m x 0.50 m

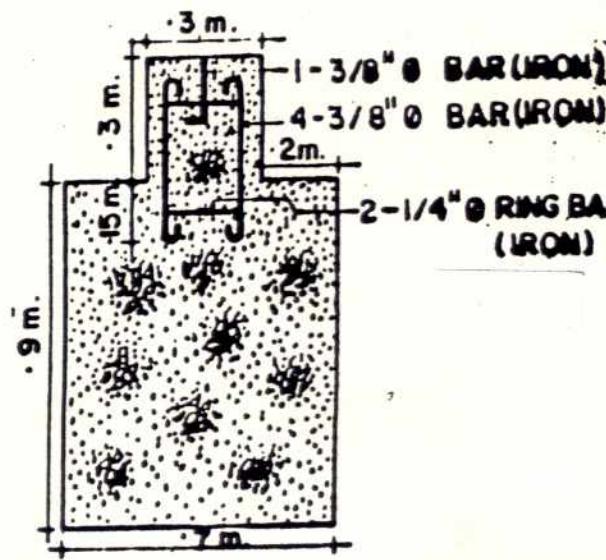

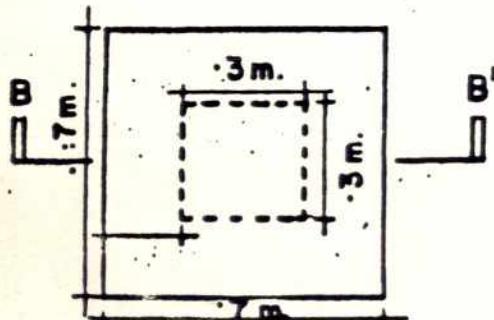

To be constructed at the site with standard finishing as per design below including the supply of all materials. Proportion of cement, sand and brick chips will be 1:2:4 respectively.

II. BENCH MARK:

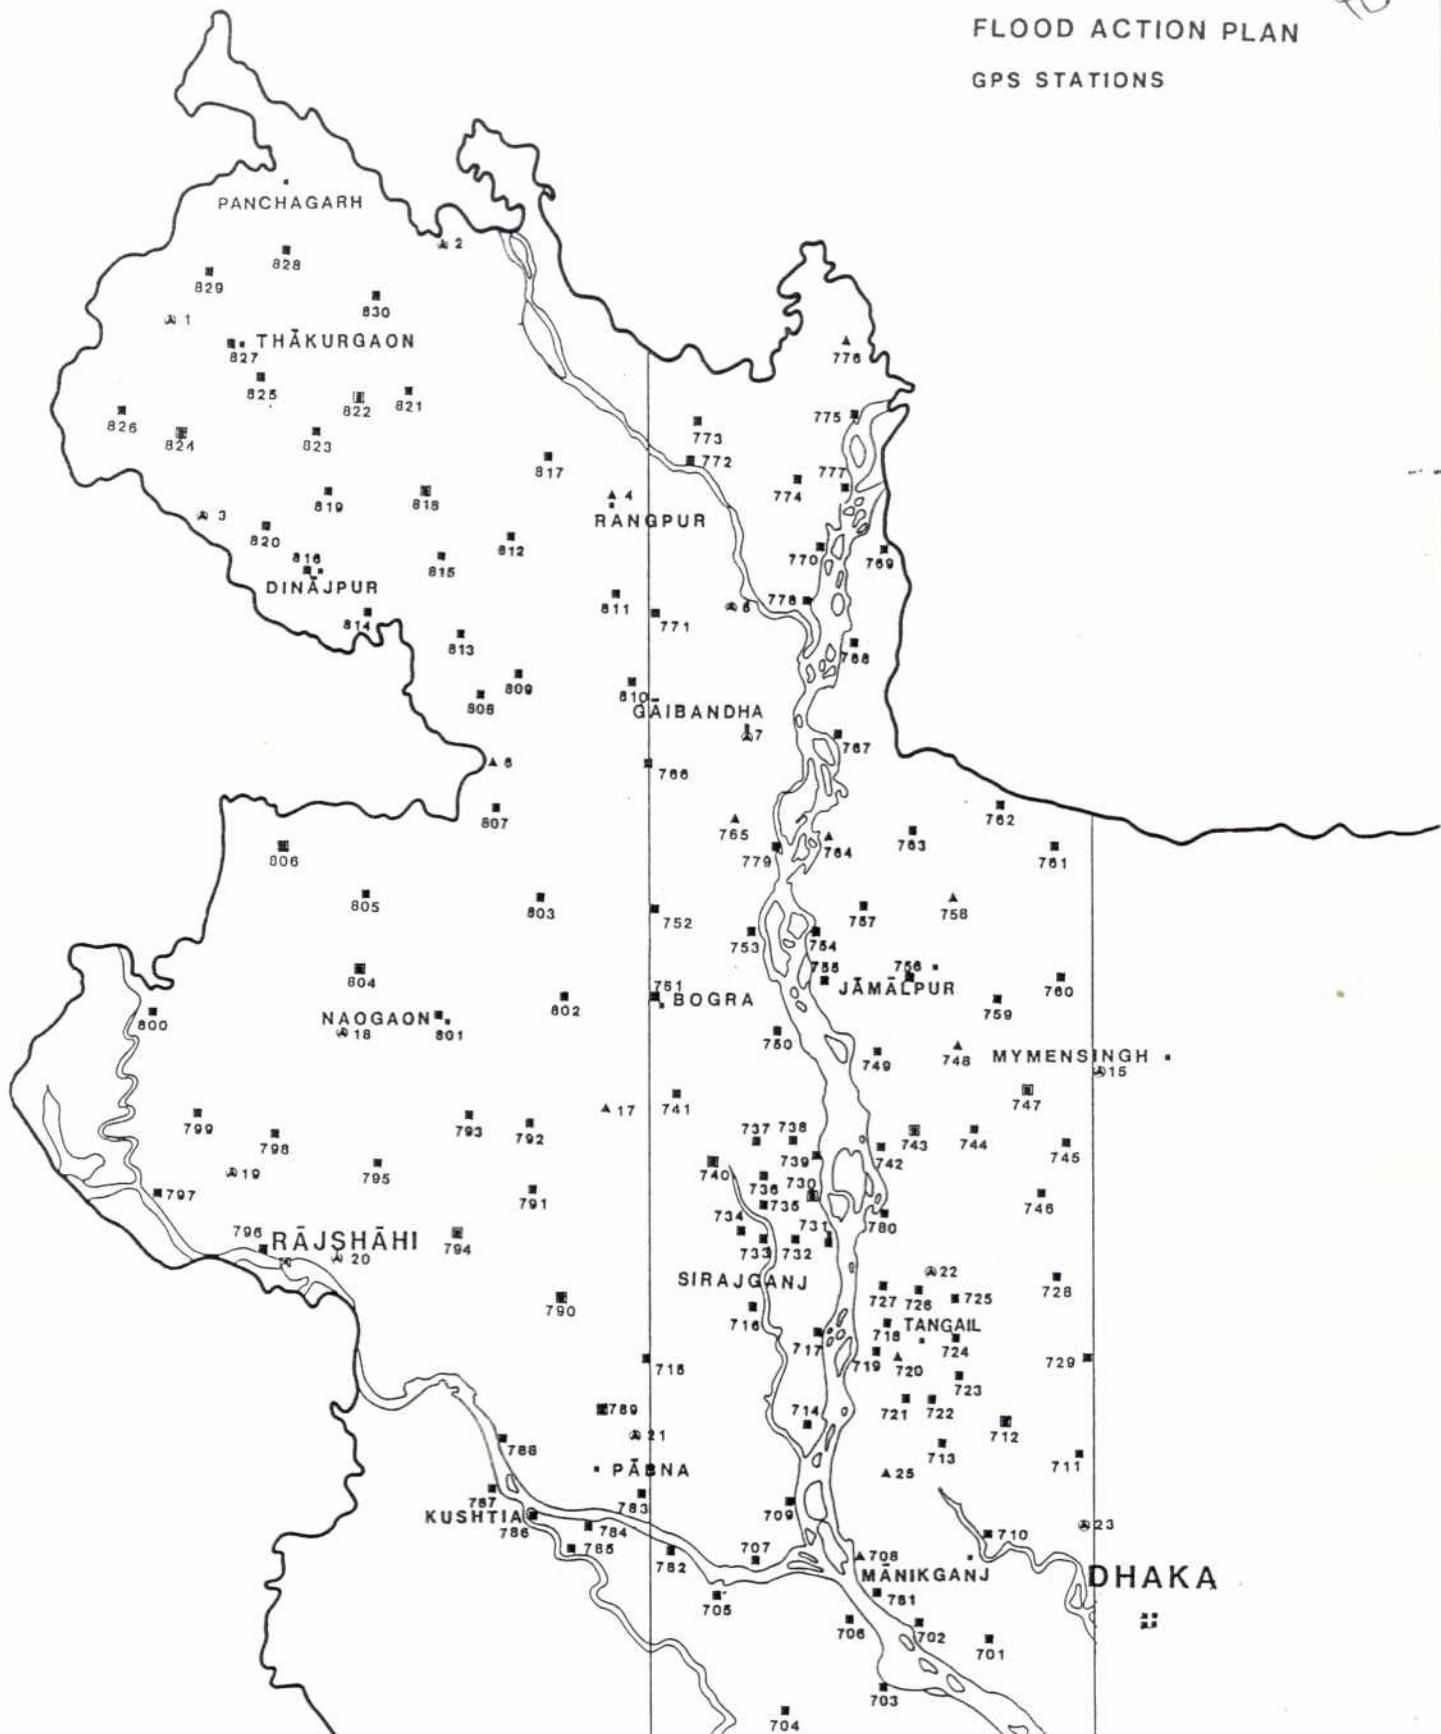

Base: 0.7 m x 0.7 m x 0.7 m
 Top : 0.3 m x 0.3 m x 0.3 m

To be constructed at the site with standard finishing as per design below including the supply of all materials. Proportion of cement, sand and brick chips will be 1:2:4 respectively.

Appendix

Simultaneous Reciprocal Trigonometric Method

In simultaneous reciprocal trigonometric method height transfer happens in two phases: First height transfer from bench marks to theodolites at both ends and secondly height transfer across from theodolite to theodolite. In the latter vertical angles are observed from both ends simultaneously to eliminates effects of earth curvature and refraction.

1. Height Transfer from Bench Mark to Theodolite

Four fixed target lines are observed as shown in picture 1.

Picture 1.
Height transfer from bench mark to theodolite.

Height difference dh is computes from observations twice:

$$dh_1 = \frac{l_1 \cot z_4 - l_4 \cot z_1}{\cot z_4 - \cot z_1}$$

$$dh_2 = \frac{l_2 \cot z_3 - l_3 \cot z_2}{\cot z_3 - \cot z_2}$$

$$dh = \frac{dh_1 + dh_2}{2} + h_{cur} + K_{ref}$$

68

$$h_{cur} = - \frac{s_{st}^2}{2R}$$

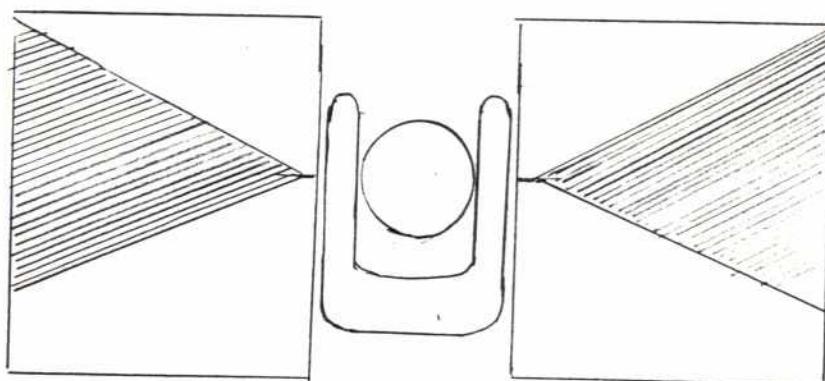

$$K_{ref} = \frac{k s_{st}^2}{2R}$$

where s_{st} = instrument-staff distance
 R = radius of earth
 k = refraction co-efficient

h_{cur} and K_{ref} are negligible.

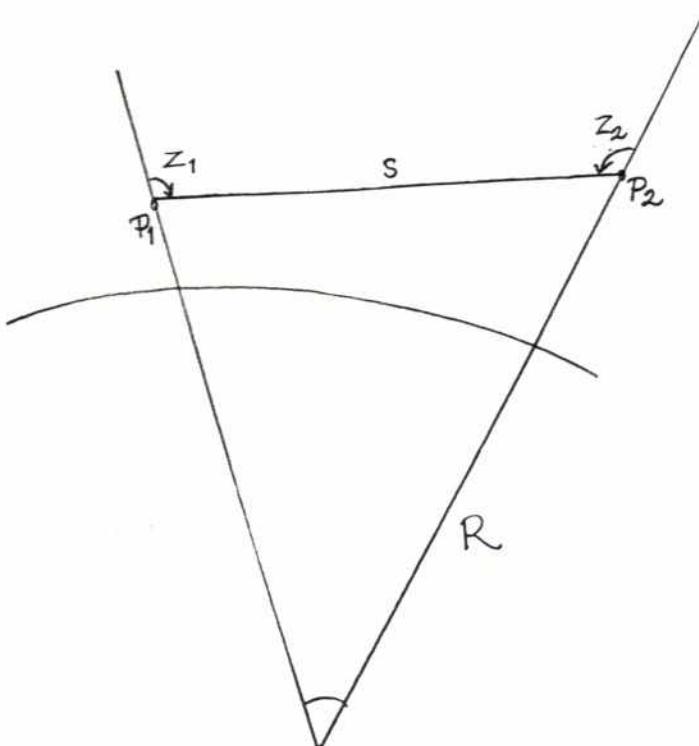

2. Height Transfer from Theodolite to Theodolite

Distance between theodolites is observed only once. For angle measurements of long distances centric targets were attached to the theodolites. The target set-up is shown in picture 2.

Picture 2.
Centric target.

Following formula for the height difference between theodolites can be derived.

Picture 3.
Height transfer between theodolites.

$$dh = \frac{s}{2} (\cos z_1 - \cos z_2) - K_{ref}$$

$$\text{where } K_{ref} = \frac{s^2 \sin z_2^2}{4R} dK$$

$$dK = K_1 - K_2$$

For sufficiently simultaneous observations $K_{ref} = 0$.

VERTICAL GROUND CONTROL
ADJUSTMENT

VERTICAL GROUND CONTROL ADJUSTMENT
METHOD DESCRIPTION

Contents:

- 1 Introduction
- 2 Source Data
- 3 Adjustment
- 4 Output
- 5 Formulas

1 Introduction

Vertical ground control adjustment is computed in VAX 11/780. The adjustment is performed by the method of least squares, i.e. the square sum of weighted residuals is minimized.

2 Source Data

As a source data it can be used the data of

- precise levelling,
- photo control point levelling and
- trigonometric levelling.

The input-file consists of

- numbers of junction Bench Marks,
- run constants and
- observation data.

Run constants indicate for example whether the levelling line is

- a double levelled or not and
- a rod coefficient is used or not.

Observation data depends on the run constants, but it always includes the following information:

- numbers of Bench Marks,
- levelling distances,
- number of set-ups in each levelling side and
- observed height differences.

3 Adjustment

The adjustment can be performed according to

- the distances or
- instrument set-ups

between two successive Bench Marks.

65

The computation is divided into three different stages.

A Computation of approximate elevations.

Approximate source elevations are computed directly from observations for all junction Bench Marks and other end points in the net.

B Adjustment by the method of least squares.

An observation equation (1) is built up for each leveling line. A line is handled as a single height difference including the orthometric correction (2) between end points and weighted as described above by summarizing the weight units of the whole line. Normal equations in the case there exist junction Bench Marks in the net are solved by inverting the normal equation matrix. If any of the improvements to the source elevation exceeds 1 mm the procedure is repeated employing the improved approximate source elevations. Finally the last improvements are added to the approximate elevations.

C Computation of lines.

As a result of previous stage each line has got the final elevations for end points. Elevations for intermediate points are computed line by line adjusting the closure error in respect to the inverse of the distance or instrument set-ups and taking into account the orthometric correction for each Bench Mark.

4
Output

In the beginning of the output list there are listed the first and last Bench Marks of each section and line with their number, elevation, and especially regarding junction Bench Marks the total correction to the approximation. Standard error in respect to the weight unit is at the end of this list.

Lines are listed in sequence of source data. Content of a line includes following information:

- adjusted elevations for all Bench Marks, observed height differences added by orthometric correction and distances of instrument set-ups which ever are used as weight
- information of the accuracy of the line;
- closing errors and
- mean errors.

5

Formulas

(1) Observation Equations

$$v = -dZ_i + dZ_j + (h_{\text{appr}} - h_{\text{obs}})$$

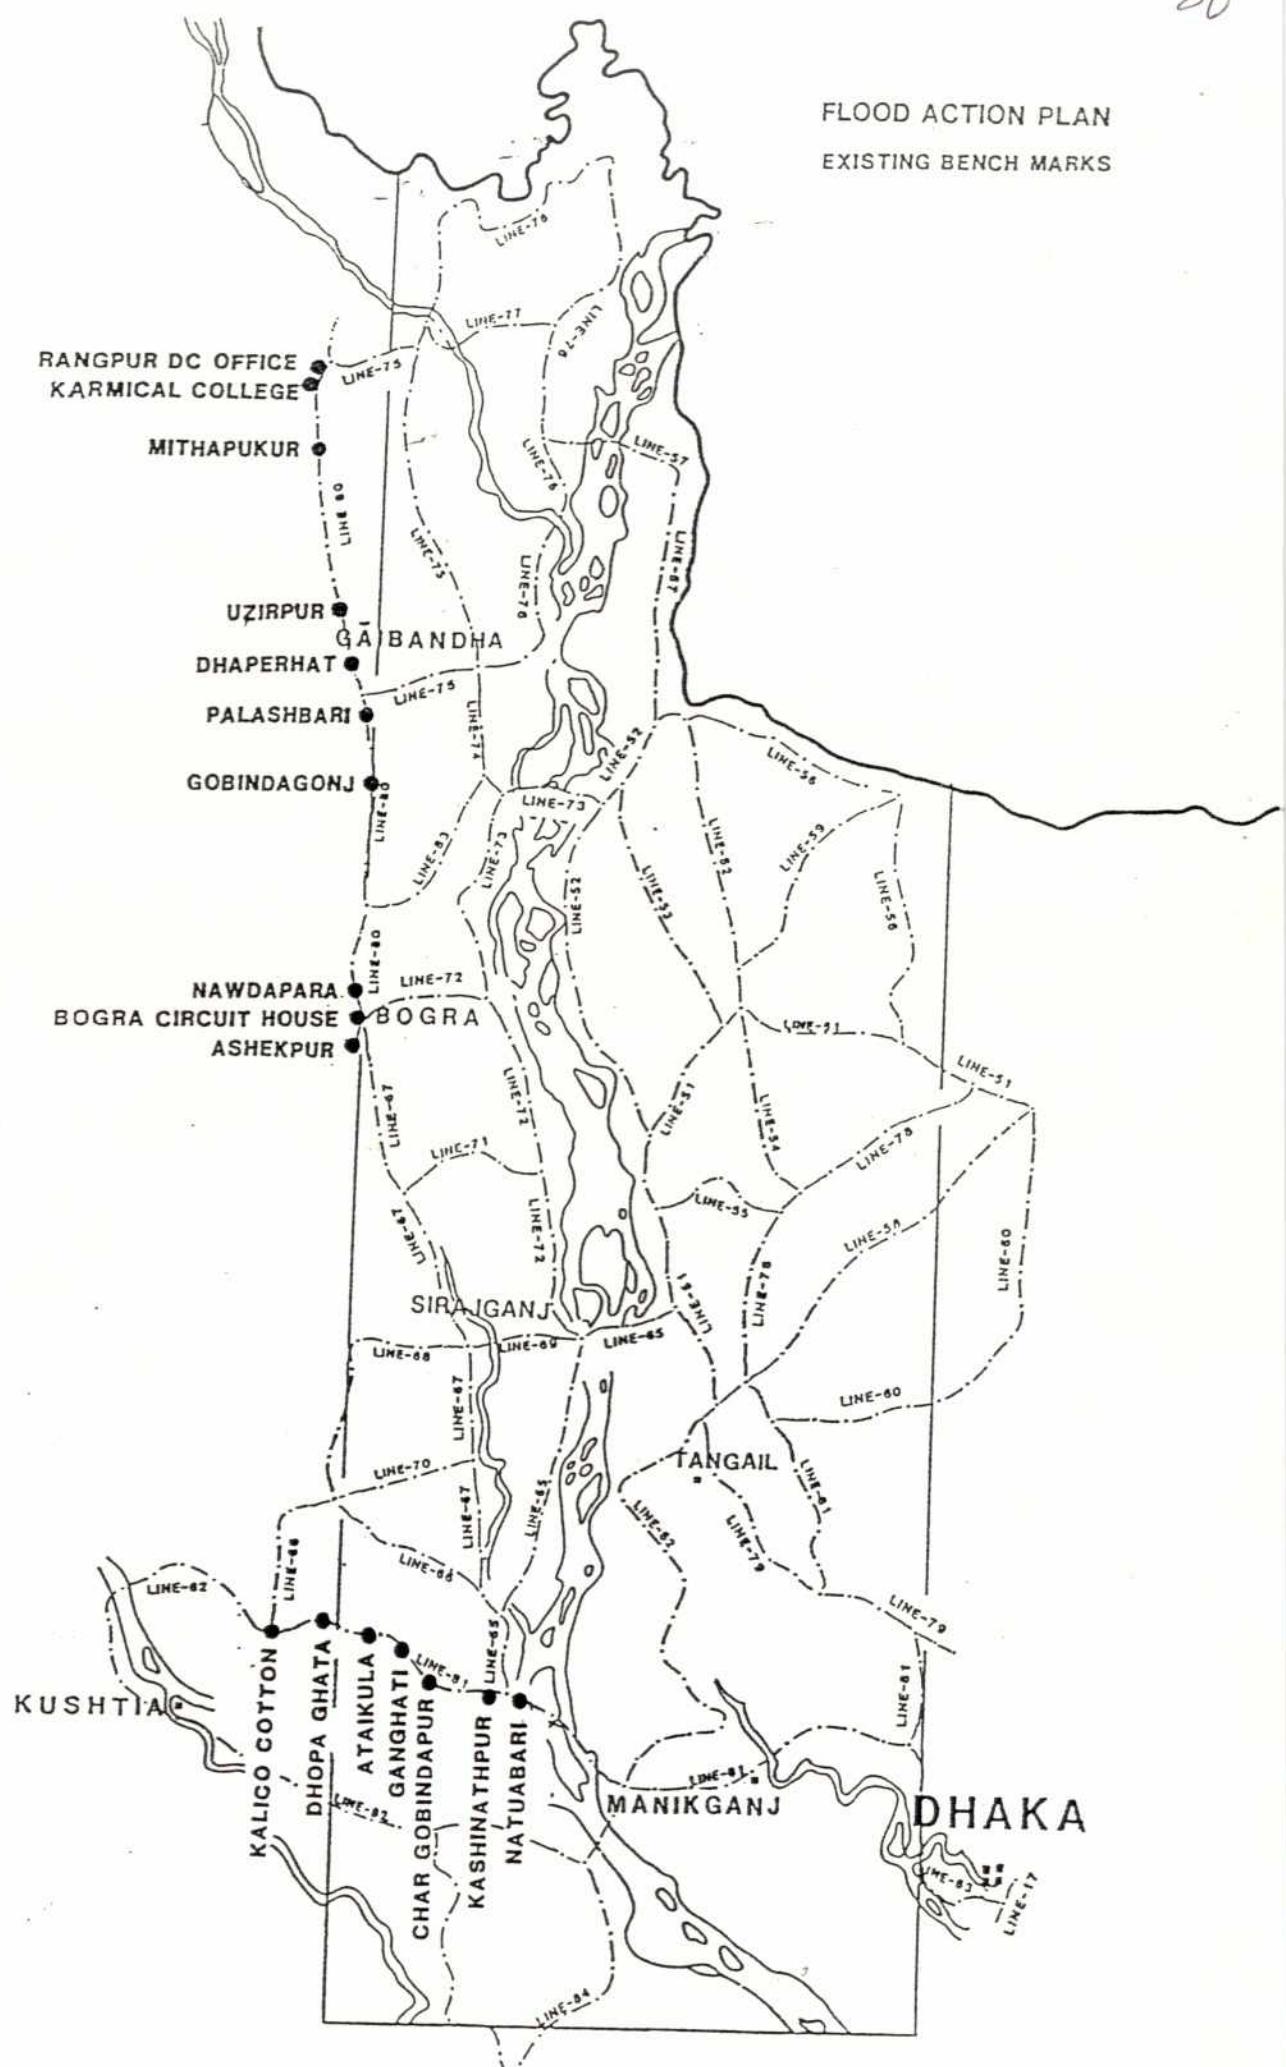

dZ_i, dZ_j unknown corrections of the approximate coordinates of the unknown Bench Marks

h_{appr} height differences between Bench Marks i and j computed with the approximate coordinates of the unknown Bench Marks and with the fixed coordinates of the fixed Bench Marks.

h_{obs} the observed height difference (including the orthometric correction) between Bench Marks i and j

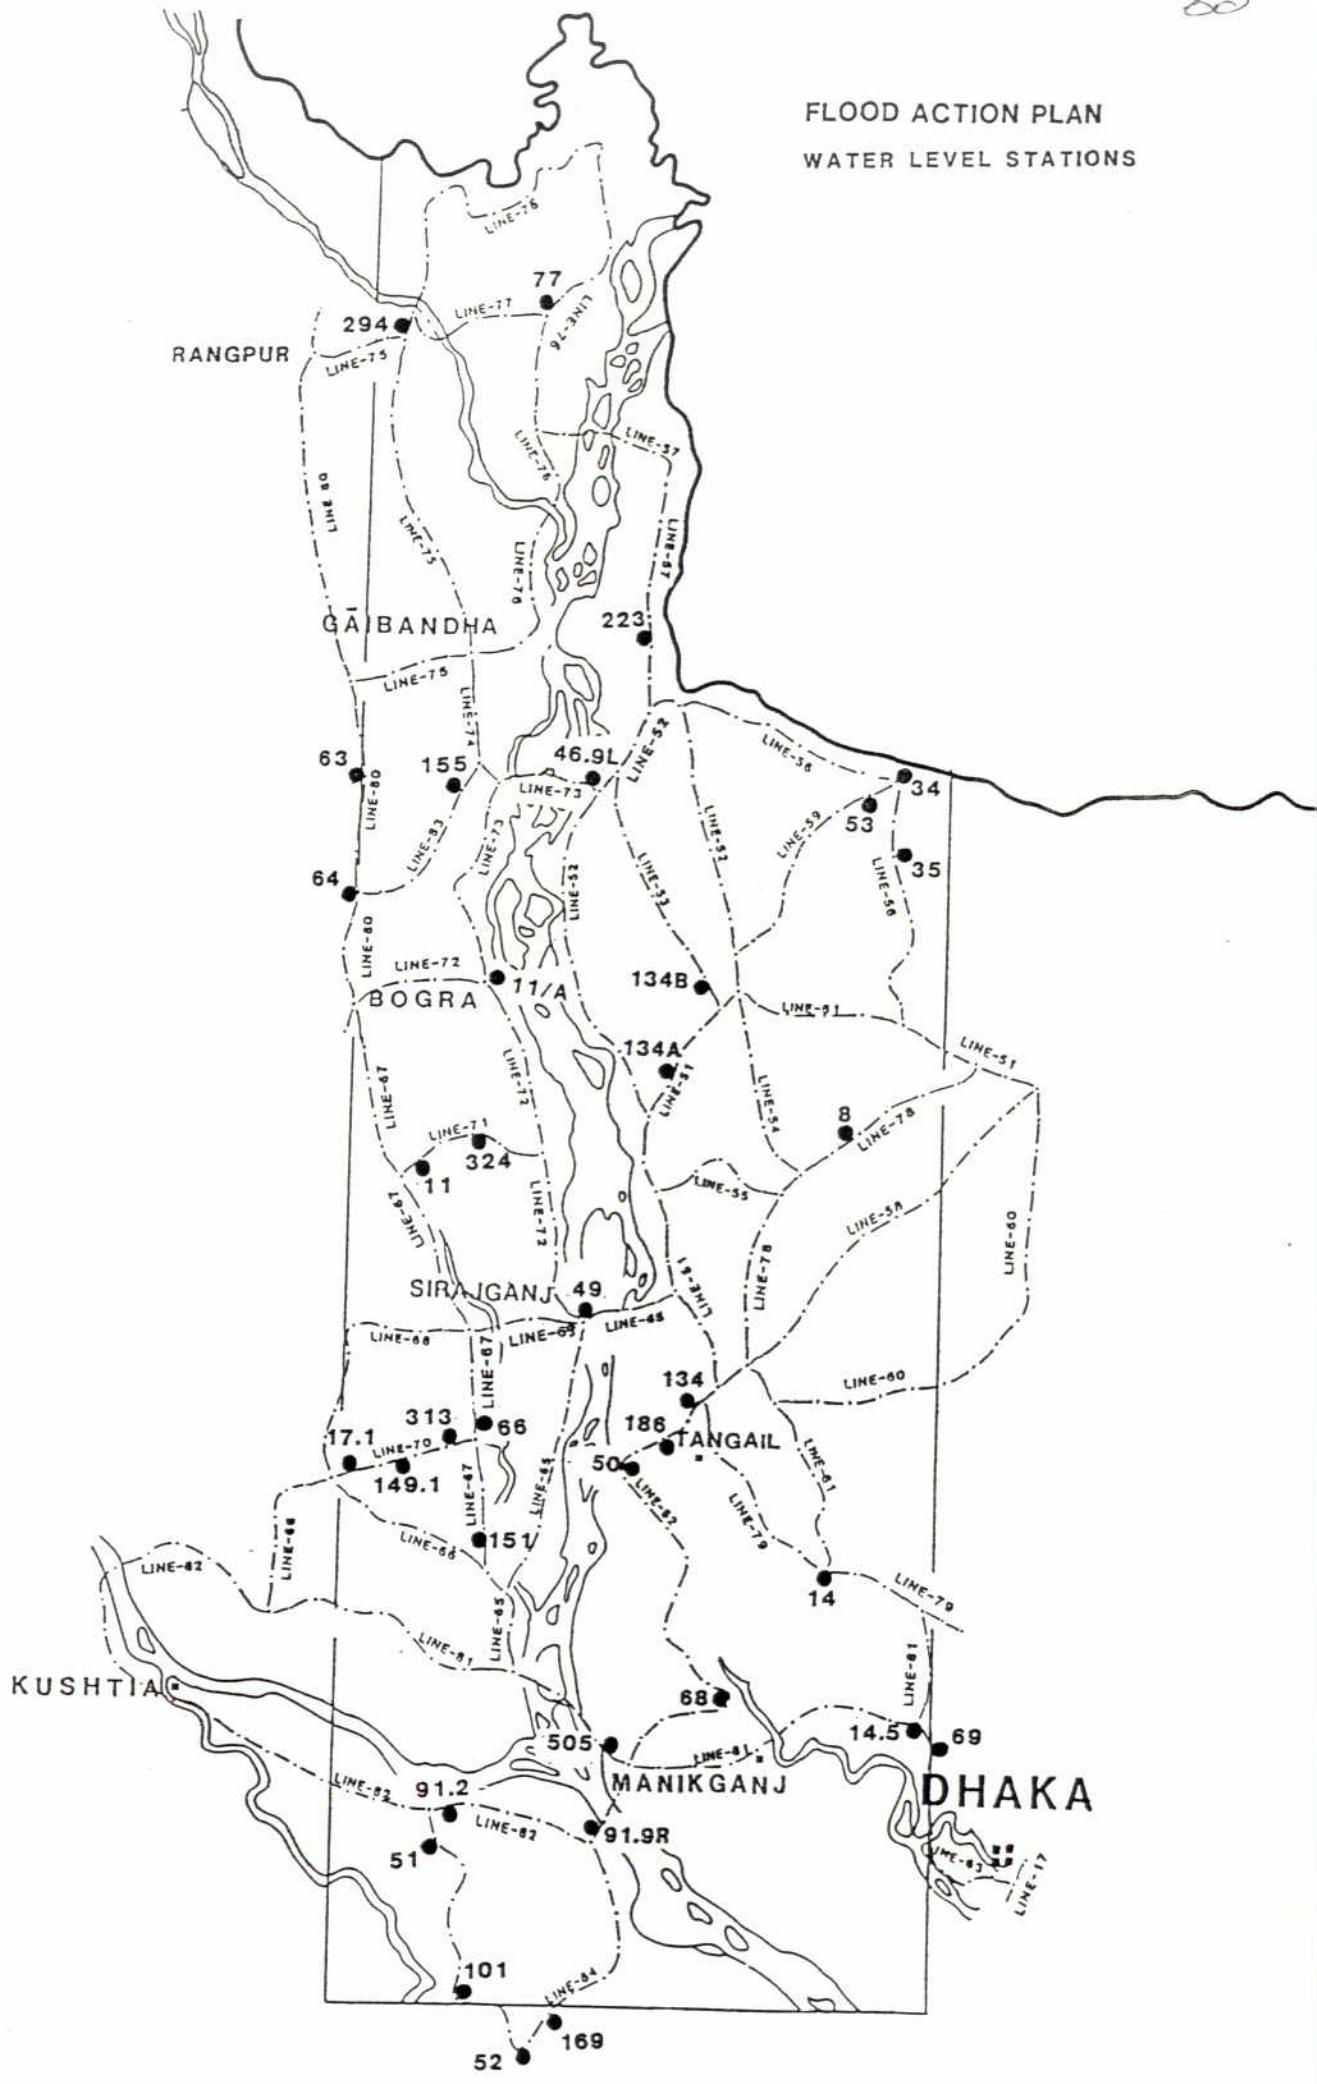

v correction of the observation h_{obs} after the adjustment

JAMALPUR PILOT AREA

FILES:

Image coordinate file	jamalpur.dat
Ground coordinate (and or. element) file	jamalpur.xyz
Output file of the adjustment	jamalpur.out
Output file for an orthoprojector OR 1	
Output file for intersectioned points	

RUN TIME CONSTANTS:

Flag for detection of gross errors i.e. for Robust-estimation (1=Yes, 0=No)	0
Flag for self calibration	1
Flag for resulting the residuals	1
Rejection limit in intersection (microm)	30.0
Resulting limit in intersection (microm)	30.0
St. error of an image coordinate (m)	.250
Termination limit of iteration (m)	.001

St. coordinate errors of control points (m):

Group-id	Horizont.	Vertical
9	.000	1.000
0	.100	.100

FLY N:o 1 : f= 151.992 H(Fly)= 4600.0 H(Ground)= 10.0

ADJUSTMENTS:

C-G-	Max.coord.correction	R-norm	Sum(pvv)
iteration	(m)	point	(m*m)
79	46200.402	24301	17.855 267410.75
141	-192.190	24301	.900 172194.56
299	185.722	24301	.028 1143.82
499	15.587	20301	.008 184.48
687	-.105	20301	.001 184.46

204

SELF CALIBRATION FOR THE FLY 1

MMH850 BUNDLE BLOCK ADJUSTMENT

SIRAJGONJ PILOT AREA

FILES:

Image coordinate file	sirajgonj.dat
Ground coordinate (and or. element) file	sirajgonj.xyz
Output file of the adjustment	sirajgonj.out
Output file for an orthoprojector OR 1	
Output file for intersectioned points	

RUN TIME CONSTANTS:

Flag for detection of gross errors i.e. for Robust-estimation (1=Yes, 0=No)	0
Flag for self calibration	1
Flag for resulting the residuals	1
Rejection limit in intersection (microm)	40.0
Resulting limit in intersection (microm)	40.0
St. error of an image coordinate (m)	.250
Termination limit of iteration (m)	.001

St. coordinate errors of control points (m):

Group-id	Horizont.	Vertical
9	.000	1.000
0	.100	.100

FLY N:o 1 : f= 151.992 H(Fly)= 4600.0 H(Ground)= 10.0

ADJUSTMENTS:

C-G-	Max.coord.correction	R-norm	Sum(pvv)	
iteration	(m)	point	(m)	(m*m)
56	12116.637	28303	14.540	14176.84

Adjustment started on 11-Feb-93 at 10:16:47

MMH850 BUNDLE BLOCK ADJUSTMENT

TANGAIL PILOT AREA

FILES:

Image coordinate file tangail.dat
Ground coordinate (and or. element) file tangail.xyz
Output file of the adjustment tangail.out
Output file for an orthoprojector OR 1
Output file for intersectioned points

RUN TIME CONSTANTS:

Flag for detection of gross errors
i.e. for Robust-estimation (1=Yes, 0=No) 0
Flag for self calibration 1
Flag for resulting the residuals 1
Rejection limit in intersection (microm) 30.0
Resulting limit in intersection (microm) 30.0
St. error of an image coordinate (m) .250
Termination limit of iteration (m) .001

St. coordinate errors of control points (m):

Group-id	Horizont.	Vertical
9	.000	1.000
0	.100	.100

FLY N:o 1 : f= 151.992 H(Fly)= 4600.0 H(Ground)= 10.0

ADJUSTMENTS:

iteration	C-G- (m)	Max.coord.correction point	R-norm (m)	Sum(pvv) (m*m)
69	15711.746	68704	17.447	90234.70
109	-60.086	856004	.889	62120.09
247	59.337	856004	.029	1295.83
445	8.356	68701	.001	31.45
455	-.004	55301	.001	31.45
